Hello

Is pin 2 on the ST's 13-pin RGB out supposed to be composite sync or
composite video? I have seen conflicting information on pinout diagrams.
It's definitely composite video from my STE but what about other models?

Alex Taylor.

Sorry Uwe - German manual - only speak english- the model is a IBM 2405 made in Singapore. Are there any Doc's floating around in english for 7.6.

Mark

PS just got HDDriver running on a centurbo Box, bloody quick;-)

G'day bob, do you have a Midi card for your Milan? Duet could be a solution
if you have.

Hmm. Those not speaking German should not buy HDDRIVER with a German manual ;-). System Solutions has been dstributing HDDRIVER with an English manual for years. Most likely they will offer upgrades including a new English manual for HDDRIVER 8 soon. Whoever is interested should contact System Solutions. Upgrades are only possible, of course, if you have your original HDDRIVER floppy disk with serial number available. I just want to stress that since there were certain problems in the past.

Hi Mark,

I have no cards, except for the graphics card of course, they are very, if not imposible to get now in the UK. With SS now showing little/no interest in Milan, it makes Germany the only source I think, I hope and pray to be corrected.

Bob King

Hi All,

Have just received following bit of lateral thinking solution to my Milan to Falcon files transfer problem from "Barrie" at Keychange. I am sure he wont mind me sharing it with you since.

"Hello Bob.

Am I missing something here?

You wish to transfer data from, I presume, one Atari compatible HD in the Milan to another in the Falcon?

The Falcon has both IDE and SCSI interfaces, can you not remove the drive from the Milan and connect or daisychain it onto the Falcon to copy the files.

We always use this method to copy customers' data from a small drive to a bigger replacement, is this not possible here.

If not I would be interested to know why, as I say, am I missing something?

```
Barrie at Keychange."

Thanks Barrie

Bob King.

I had a similar problem.  Actually it was the voltage regulator.  Check
your power with a DMM and verify you are getting 5V.  I am not sure why
it went bad, but was probably due to hours and hours of abuse ;)

Why didn't you send these copies back to Titan? Anyway, most likely
System Solutions will offer upgrades to HDDRIVER 8 optionally including
new *English* manuals. Please contact System Solutions for details.

Mark Bedingfield wrote:

> The software is english but the manual is German..

Just to clarify this: The software is always the same, i. e. there are
not different binaries with an English or German GUI. HDDRIVER and all
of its tools have a German GUI on a German TOS/MagiC, English GUI
otherwise. This can be toggled when starting the programs by pressing
the Alternate key.

I still have some problems on my HD with MagiCMac, I've lost some files and other clusters around I would like to recover, I had a try at DISKUS demo but I can't understand how it works, German is too hard for me, so I tryed something else to at least be able to:

- make searches of ascii strings on the partition
- select blocks (clusters/sectors) of data that I see were part of a file
- save blocks of data as a file

The only program I found that works is my old KNIFEST, but it lets me build a file only by saving each sector manually, and it is impossible to do it for so many sectors, what chancec do you give me ?

I tried the new Norton 2001 DiskEditor connecting the scsi disk to the PC, but it does not see the disk as the older version did, unfortunately.

Is there a program that runs under MagiCMac, MacOS or PC that could let me recover that files pieces ?

Ciao, ** *Mike* ** www.interware.it/users/mike/ mike@interware.it

Does anybody knows how I can do that ?

I have an old (but good) BJ 330 and the only driver I found for it was for a BJ 10. But it seems that it doesn't work very well. So, I would try to write a dedicated driver.

Can anybody help me ?

Thanks.

The card is a standard PCI SCSI card with a LSI53C810A controller chip which are available from multiple vendors - one is the Asus SC200.

You need a driver for that card, which is available from multiple dealers - if you have problems reching one, I can sell you a copy directly, but getting the money to my account in germany might be a big problem.

Hi Michael,

now that's what I call usefull info. Can you send me a list of dealers,
one of them may do credit card transfers.

Hi Bob

>try clicking on HDDRIVER.PRG with alt held down, should come up in
>english! My version does anyway.

I think Uwe would know that, he put it there. 8~)

A simpler way if your desktop will allow it is to install HDDRUTIL as an application and pass it the command line -e for english language.

That reminds me Uwe, did you fix the command line bug i reported in version 7.91.

Try running the hddriver.prg that's in HDDriver's AUTO folder. Once that's scanned the SCSI bus it should then allow you to install the driver on the hard drive.

Well Atari DID produce these, so you can try the version out before committing yourself.

I've also got the TOS on disk that was supplied with the Falcon!

Atari never distributed TOS >1.00 as a disk release. There were versions
available for beta testers, but not freely distributable.

If you don�t buy it from someone who has a license to produce TOS copies, it
is illegal no matter if it is on disk or on EPROM.

There still seem to be plenty of switchable Atari/Amiga mice about - I
bought one for �2 at the Stafford show. System Solutions should have one
as well.
Or you could use Mario's serial port adapter that allows the use of PC
mice - sold in the UK by Chris Crosskey of Abingdon Synthesis projects
(chrisc@zetnet.co.uk).

hey everybody i personalyl miss the atari i think there great machines
i really wish i hadnt gotten rid of the 1040ste For a PC and i find the emulators to be
anoyying and just dont give the real feel, but i came accros this milan
computer site apparently Germany have carried on the Atari realeasing new version of tos
and new operating systems that looks "spiffy" i am very very curioius
has anybody ventured down this path does anybody know what there like ??

as for this magicos and mint , its all soooo confusing i feel like i have been left behind
can anybody explain

or email me

regards

Marc

Hello

I bought a faulty STFM for �1 and need some help.

The RF modulator kept going off, i.e. screen went blank and lost sync. Hitting the machine sometimes restored the picture. Yesterday it wouldn't so I opened the machine and tried testing some voltages inside it modulator, without really knowing what I was doing. So I ended up breaking the modulator completely, along with some strange noises, a puff of smoke and a nasty burning smell. The ST itself still works though. Now to solve this, I could use any of the following:

1) An RGB to SCART lead. I know there's still output from this socket because I checked it. Where can I get one of these in the UK???

2) A replacement modulator, either the part or even a complete scrap STFM. Anyone know where I can get one of these?

3) Since I don't really know what I'm doing, a better solution than 2 would be someone to fix it cheaply for me, bearing in mind it only cost �1 to buy. Anyone fix ST's in the UK, preferably somewhere near Nottingham?

I hope someone can help me with this since I only started using the ST in the last week and already I love it! Some of the games are really great and I like GEM for it's simplicity...

Alex Taylor.

Hi,

I am looking for some help to wire up my 1040ST to an NEC 3D multiscan monitor.

I have an Atari 13 pin Din plug and I have the 9 pin connector for the monitor. I have pin layout diagrams.
I now want to make a lead to join the two. Which pins do i need to solder to which ?

Off Topic: !!!   I would also like to use the NEC 3D to watch films from my VCR . Anyone know how I can connect a SCART out into the 9 pin RGB connector on the monitor ???

Thanks for your help !

DOITST contain them, colorised schematic.

Isn�t easy. Needs an hardware signal adaptor. Sync frequency doasn�t
match. Signal adaptor generates right VGA signal out of an VCR-output.

Costs nealy 170 DM. Source: www.elv.de
Search for video adaptors.
All pages german only.

Surely if the NEC 3D Multisync will work down to Atari Low and Mid,
which use 15 kHz horizontal/25 vertical, then it ought to be able to
take TV signals too? The whole point of these resolutions was that you

could view them on a TV set, so it should work the other way round
too... But probably you'll get no sound unless you add a speaker.

Yes, with an old NEC 3D. You try it with an NEWER VGA monitor?

Hi FOlks....

a group of us on Tim's Atari MIDI mailing list are getting a
programming group together to do some utilities we need....we want to
make sure we're all using the same software for programming and it

looks like LAttice C has won....we need to get our hands on a few
copies of 5.n ......we need Falcon and TT compatibility....we'll prolly
end up building our own ligbraries unless anyone knows of a big library
resource out there on the net for GEM and TOS, especially MIDI
routines....

chrisc

9 pin? Are you sure? My 3D has got a standard 15-pin VGA connector.

>I now want to make a lead to join the two. Which pins do i need to solder to
>which ?

I suppose it's a 9-pin VGA connector, so try http://www.hardwarebook.net/.
It's got pinouts for both the Atari and VGA connectors.

>Off Topic: !!!   I would also like to use the NEC 3D to watch films from my

AFAIK the 3D won't accept a composite signal.

I suppose you aren't familiar with the Nec Multisync 3D. It's a multisync
monitor, which will synd down to the 15 KHz vertical frequency of a TV signal.

I can't comprehend the fact that people in the year 2000 are arguing about
a bloke who'd like to use a UK TOS instead of a German one. A TOS which was
released more than ten years ago. I doubt that even Atari would be that petty.

I have so called "language disks", too, but I haven't got a foreign TOS for testing them.

You can watch tv on them. I have one and having used it as a monitor for a vcr. It takes both 50 and 60 Hz just fine, but that's using a rgb scart cable, I don't know if just composite works.

I have been trying to install Magic 5 on my Mega STE, it is the upgrade BUT
I have the original version 2.

Everything would appear to install OK but when I restart 'magic.app' (or
something) runs but eventually crashes with 4 bombs, I then get a program
selector appear which will run programs.

Any one any ideas???

Elliot...

NEWER models, OLDER models, what i mean last time. Easy, or?
15Pin models is not sure it will work.

OLDER ones do that well, not ALL of newer series.
What i wrot, mean, last time.

Thank you.
Used an OLD NEC 3D multisync for playing jaguar console.
It won�t work with newer models.

Thanks for all the answers so far guys.
It seems clear that my NEC 3D can play video from my VCR.

So, How do I make a lead to play SCART out to 9 pin RGB monitor in ???
Is it a simple cable SCART plug to 9 pin ? If so what is the pin connections ?

Two days ago I ordered 10 pieces of paper money from 10 different countries from a company called Perth Numismatics. Lo and behold they arrived today and they are very nice and colourful. They even have a bill from Antarctica. I didn't even know they existed. These are perfect for stocking stuffers or people who are hard to buy for. The website address is www.perthmoney.com
Good luck and Merry Christmas

Mine does (feb 1991). It came with 15 pin mini Dsub connector.

A friend of mine couldnt connect his Archimedes to a newly bought modern monitor. My Nec 3D accepted the Archimedes' composite sync. If I remember well it was composite on green.

Hello there

It's my STFM with no video output again. I really do want to fix this machine.

Ignoring the broken modulator, I have no composite video output on pin 2 of the monitor port. I think this was the original fault, and I broke the modulator needlessly :P The signal from pin 2 is a dark, blank screen with a rolling diagonal stripe.

Anyway, what could cause this loss of composite video? I have run the other signals (R,G,B,h-sync,v-sync) into a composite input of a monitor and get something on the screen, so it must be the bit that combines the video signal. There are signs that a small grey box near the modulator has been resoldered.

If someone could help me get a video output from this I'd be really glad. I want to do it without just getting another motherboard.

Alex Taylor.

Composite sync? I'm talking about composite CVBS video.

As long as they are abandoned, I won't classify that as stealing. Please lay
off this cars/jewelry analogy, it doesn't work with digital media.

This guy has already got a legal TOS. He just doesn't like the language it's
in. Are you to deny him the pleasure of running an English TOS?

Since VTRs don't usually output RGB, I think it's clear that it supports composite video.

I think I will.. after looking at the quality from the composite output of
my STE compared with the RF output, there's no comparison. Time to buy a
SCART lead I think.

I got the schematics to wire up a cable for High-res monochrome from the ST
to a SVGA monitor and it has worked a treat!

SVGA		ST
Hsync	to	Hsync
Vsync	to	Vsync
R,G,B	to	mono video input
Gnd	to	Gnd
Gnd	to	mono detect pin

Now what i'd like to do is to make another cable to have colour on my SVGA
monitor for low and medium resolution so i can play games. If someone could

please post the schematics to get colour on SVGA like the one above. I have the pin numbers from the manuals but just need to know what goes where.

Thanks for reading.

A normal (S)VGA monitor won't work, since the ST's colour resolutions has a horizontal frequency of 15KHz. What you need is a multisync monitor.

Anyway, if your monitor *can* sync to 15KHz, you only need to make a few changes to the above cable:

1. R,G,B on the SVGA must be connected to R,G,B on the ST.

2. Install a switch between the mono detect pin and ground. When the
switch is open, the ST runs in colours, when closed it switches to
monochrome.

Unless your monitor will sync down to 15.1 KHz vertical, it is impossible.

atari folks,

Advice wanted: 2 atari game consoles not working.

I've have 2 Atari 2600 game consoles which I just brought out of storage. Neither of them work now, but both used to work at the time they were stored. Anyone have ideas on what component(s) might go bad after 15 years of storage?

Symptons:

1. When switched on, the TV turns from white snow to a mostly blue-ish snow (there are a few other colors visible). The sound is silent.

2. Sometimes removing the cartridge (and yes, breathing into it) & re-installing the cartridge causes small artifacts on the screen, but the screen is primarily snowy. Sometimes I also get a low frequency hum or beep.

3. When I remove the "TV-Computer" switch, and then hook the console's RCA out directly to the TV's antenna leads, the outcome is the same.. (This was done to test the continuity of the "TV-Computer" switch - apparently its OK).

Might any of you have any similar experience? Are there any common problems with stored atari systems?

Is it likely the cartridges went bad? (Unfortunately, I don't know anyone else with a working atari to test)

I'm armed with a philips screwdriver, a soldering gun, and I'm not afraid to use them :-) Any suggestions would be greatly appreciated. You may email me directly, or simply post. Thank you.

Hi Iggy

>>Ok, your right, i'l only steal 10 year old cars and jewelery in future,
>>do you have any 10 year old money?.

>As long as they are abandoned, I won't classify that as stealing.

I hope you dont live in my neighbourhood, your standards are about as low as whale-shit.

How would you define abandonded?, probably to suit your need for the item concerned. Anyway, being abandoned doesnt mean it is ownerless, it just means the owner doesnt want responsibilty for the problems its causing.

That scenario doesnt apply to TOS, its not abandoned, its just not being developed, would you consider a house that dont get rebuilt every year abandonded!!

>Please lay off this cars/jewelry analogy, it doesn't work with digital
>media.

Theft is theft you moron, of course it works.

But if it dont work for you, can you send me all your software to save me
the trip to break in for it.

>This guy has already got a legal TOS. He just doesn't like the language
>it's in. Are you to deny him the pleasure of running an English TOS?

No, i'l not attempt to deprive him of anything, he's welcome to buy an
OS, like i had to, and many others with morals higher than yours.

Hi Alex!

As you may gather from other postings in this topic recently, this is only possible with a few Multisync monitors that can synchronize down to TV frequencies (15 kHz/25 Hz), line the NEC 3D (perhaps only older models). Most SVGAs only go down to 30 KHz so can't display ST Low and Mid. I suspect you will have to use a TV or (better) get a TV-compatible monitor with RGB inputs.

ST does not output through RGB pins mono information, nor color info through mono out pin. To do that, one must install small hack on the VIDEO circuit. Essentially, whole hack consistis form nine OR gates....

Been there, done that. All other solutions are awkward. If one is familiar with electronics,
then investment into EGA monitor seems to be the "most bang for a buck", if not, one should find
some old NEC, or maybe AMIGA monitor (not 1084S, but the one meant for A1200 that still supports PAL).

If doing the hack, one more thing might be of help. When doing layout for ST, designers have made one errorr.
Noisy data bus lines that go to the shifter are routed straight through the sensitive R-2R ladders that do the D/A conversion.
Becaouse of that, there will be many ghosts, especially in mono resoulitions (I don't know exactly why mono is more affected).
Physical movement of some resistors in board away from critical area gave drastic

improvement and heavenly clean picture.

If anyone is interested in doing that and need extra info, I would be glad to help.

Regards,

Branko

Anyways, some (purely hypothetical) questions:

1) *IF* such a computer, with the specs I list below, were to be released... by Atari, mind you.... would you buy one, provided that you could run (at least) old ST software on it?

a) 1040ST and/or Mega ST case
b) 32-64Mb of RAM
c) ATI accelerated 3D video chipset
d) Yamaha XG audio chipset

2) If that unit came in two models; the 1040ST-styled one being less powerful than the Mega ST model, which would you buy?

a) Home
b) Business

3) Would you be willing to pay $1,000 for the 1040ST-style and/or $2,000 for the Mega ST model? If not, what would you be willing to pay for either?

3) If Atari, as a computer manufacturer, returned, would you be excited and

tell others?

Please, no smart-ass remarks or non-serious replies. I am planning on compiling the number of users that reply positively to this post and I'll post this message to other Atari newsgroups and elsewhere to see just how many people are out there that *would* be willing to buy such a system. No need to repeat reply if you visit more than one newsgroup this message is at.

If you know people that might be interested, show them this message and let me know if they are. I'll add their numbers to the list. I want to see just how worthwhile my idea is to the general Atarian/non-Atarian Internet public.

Thank you for your time...

Jared

No. FPM and EDO are opposites. Parity is just additional bits (33 or 36
instead of 32) and can be with a FPM or EDO SIMM.

>The problem on the SIMM becomes a problem for the user.

If the SIMMs are broken, bring them back to your dealer.

cu

You know, I had a relatively brilliant idea hit me today (provided it hasn't already been thought of or done). Instead of emulating ST hardware, why not make a PCI card that has the ST right on it! Not just the ROMs and/or one or two parts, but 95-100% of the ST's hardware on it!

If you look at a 1040ST, there's a LOT of wasted space. Especially considering today's technology and design. You can get circuit board traces down to a fraction of what they were in the old ST. And resistors/capacitors? They're microscopic surface mount devices now. Substitute the 2 or 6 ROMs for one ROM (or a tiny, surface mount Flash ROM, like PC's use today. For the RAM, use SDRAM chips, which are much higher density and surface mount also.

For the rest of the ST parts, take them out of old ST's! Unsolder 'em all! That CPU, GLUE, MMU, and stuff. Put them on the new PCI board. If I don't miss my guess, I would say the reduction of some part numbers/sizes and trace width should reduce the overal board size to a board you could put in a PCI slot.

In order that you could run this "ST card" on a PC or PowerPC motherboard, using a standard video card, you would probably be best to emulate the video shifter, so that you can run the ST in a window on your main OS. If you kept the real video shifter, you'd probably run into problems trying to get it to work with an SVGA monitor.

Now, since the "ST card" doesn't have any ports on it, you need to write software that translates or redirects the functions of the ST (like the sound chip for the printer port) to the apropriate hardware. You might even emulate the floppy chip in order to use load/save files to and from your main hard drive or floppy drive, etc. You would create an ST Environmental Partition (STEP) file on your main HD, that the ST card used, thinking it was a MegaFile30 or whatever. Of course, you have to have a program that gives you access to the ST Card in the first place.

Now, assuming any of these is reasonable or feasible or worth pursuing at all, we port GEM or MiNT or whatever ST-derivitive OS to PowerPC (if we want to go that route) or Intel Pentium. In the case of Intel, we wouldn't have to port GEM at all... it's already there on that platform. We'd just continue to improve upon it until we felt it was worth calling "GEM2000" (or GEMillenium or whatever).

The ST would run at full speed. The hardware would satisfy *all* software, because it was genuine, not emulated. You could probably even run those copy
protected games on diskette (assuming you have any)!

Then, we take the opportunity to use the ST Card to port as many existing apps as possible to the new GEM (or whatever OS we go with) on the chosen processor. We have the best of both worlds!

We save money on parts, because we use existing parts from old STs. I was lucky to find a 1040ST for $5.00 at a thrift shop. The only question is... how much would it cost to produce the PCI PCBs and transfer the existing parts to them.

Any ideas if what I have just suggested is pure silliness or not? Seems at least a little more reasonable than my previous ideas... hmm?

Jared

If you dont cease this endless dribble soon i will forward every reference to this thread to your ISP with a nice note.

If you are really passionate about this scheme then set up your own newsgroups and stop polluting /ALL/ of the one's i read.

Please, piss off, you are getting really friggin annoying, you havent gained one single supporter during your crusade, get the message??. Which bit of "No", dont you understand.

Old news, this has already been done. It flopped, partly because it was quite expensive but mostly because it was soon outperformed by pure software-emulators. However, there are some advantages with this, the most important one that you can very good MIDI-support.

What you described sounds very much like the Gemulator hardware!

I know you mean well, and don't mind because IDEAS (no matter how silly they sound) are what makes the world today! BUT other readers seem to be getting a little fed up of the different threads you are creating.

If you kept to one thread and changed the subject slightly, they may be more forgiving.

MInd you, you certainly are get coverage:)

IIRC the GEMulator hardware was just an ISA-card with TOS-ROMs. Or was there a more advanced version available?

I have this TTM195 that doesn't work and I want to give it away to someone who thinks he would have any use for it. The monitor is a Philips inside and has no technical resemblance whatsoever to the Moniterm Viking innards that TTM194s are containing. It is intended for use with the Atari TT only (NOT with the Mega ST that has the ECL graphics card!).

Looking inside the monitor one can see that some parts, like certain capacitors, are missing. I don't have the time, knowledge or energy to try to fix this.

Preferably someone in G�teborg, Sweden, could pick up this TTM195 personally. However, I could consider sending it if the receiver pays the freight. The monitor accepts 240V~.

For the right person, a tv repairman with schematics from Best, this could be a bargain, since only a handful components are missing. But, on the other hand, this monitor could be so bad it's beyond rescue. I really don't know. You'll have to chance it.

If you're interested, please email me:

graiter@starmail.com

At least, he _should cross-post_ with an appropriate followup-to and
not multi-post if this make sense to anyone.

Just my two cents of "netiquette".

Bye,
/Pascal/

Hello,

My Falcon has decided not to like my AB-card :-(
I have had the AB installed without problem for some years now. I have
also made a digital 030/040 switch based on Geir �yvind V�lidalo's
switch.
But now I have made the line level sound modification on the sound
ports. (This seem to work perfect by the way.) Something must have
happened because now the computer won't start when the AB is plugged in.
The following has been observed:

Without the AB040 (and the jumper between pin 20 and 22 on expansion
connector J20): Everything is perfect, every time.

With the AB040 plugged in (the jumper on the AB card):

Switch in 030 position (disabling the 040):
- about 20% of the times everything is ok.
- the rest of the time (80%), the computer does not reach the white boot
  screen but the monitor shows flicker in dark blue or red.

  (when things are ok the characteristic two dark gray fields are shown
   in the topmost part of the screen before the boot screen. When
   things don't these does not appear.)

Switch in 040 position:
- about 5% of the times everything is ok.
- the rest of the time (95%) the white boot screen is shown but the
  computer crash before the whole fuji logo is drawn.
  (is just freezes half way.)

I have tested removing the 030/040 switch with the same result.

I have checked the clock patch with an oscilloscope.

I have removed and reinserted the memories.

Anyone that has any idea of what could be wrong?

/Jonas

When I have had problems like this in the past, it was almost always a
problem with the clock patch somewhere. Do you use a resistor near the
DMA connection? I don't have the 030 switch installed, don't know what
to look for. Other problem with my Falcon was a bad GAL, but the machine
was dead black screen, not white screen. Somewhere there is a bad clock
it sounds like.

While you are wrong in some respects (I have written down the names of about 4 or 5 people who seemed at least somewhat supportive of my ideas in one way or another), I do realize I am digging in the dirt to find air (i.e. going in the wrong direction) most probably.

Without enough supporters and/or people willing to use what talents they have to even advance my dream just a little, talk alone gets us nowhere.

I will now digress (degress?) and cease further babbling on the subject... or at least promoting it any longer.

I've got too many bruises on my head not to realize I've been banging my head against a brick wall awhile. Sad, but true.

However, if I may ask one small, final question... does anyone KNOW how many layers the Atari ST (1040ST, Mega ST, and STe) motherboards were comprised of? I know about the parts side and solder side and double sided and vias going from the top (parts) to bottom (solder) side and vice versa, but... was the 1040ST board only a double sided board? If not, how many layers were involved? I'm talking about electrical paths (traces), not solder mask (whatever that is) and silkscreen, etc.

Thanks.

Jared

It looks like a DMA/clock-patch problem of some sort. When I've had
```

problems like this (usually caused by the Nemesis or it's clock-patch) it
has always been a cold solder-joint, broken trace (not unlikely
considering the nature of the line-level fix) or that the DMA-patch needed
tweaking.

You should also check the DSP and the DSP-clock if you've done any mods
there.

Hi!

Just what is the definition of a device as far as Ataris are concerned?
Theoretically it should be anything addressable by software, I guess,
including printers, scanners and the screen etc., but am I right in
thinking that normally it is only understood to be a drive (floppy or HD
partition)? The word comes up frequently in a program instruction text
based on someone else's work that I am finalising, and I'd like to get
it right!

Regards, /Peter/

Hiya

Oh! yeh! a word we all use for granted without a thought!

I would say a device is something that can be interrogated and provides
some kind of feedback. It may also be used in context.

SCSI device = anything that connects to the SCSI port

I suppose on the Atari's nothing much besides a printer gets connected
to the printer port, although there are other things.

Very good question though:)

: I have software which copies the TOS ROM onto disk.
:
: I was wondering if I could burn this copy into EEPROM and
: manage to fit it into my STe. is there any software/way of
: doing this if it is possible. I heard someone had wired
: TOS 2.06 into his Atari ATW800 workstation.

The 2.06 already *is* the "same" as the 3.06. Atari Corporation
took a 3.06, removed all the unnecessary drivers for hardware
only present in the TT, added some other drivers necessary for
the ST/STE range and adapted the whole thing for the M68000
processors. Voila! The 3.06 transmogrified to a 2.06!
What you're looking for is what you already got!

Rather try and find a copy of TOS 5.xx, if it exists, because

this one is supposed to work on all the Motorola 68xxx processor
Ataris. It is a Falcon TOS modified to work on all Ataris.

> it sounds like.

Both of my Falcon's have karked it in the past in simillar styles. One was a Rom with oxidised legs, and the other was a GAL that had been butchered by the previous owner, attempting to do a clock patch. The GAL's leg was actually broken and it was only tesile contact that caused it to work at all. First things to check with any Falcon is ROM, GAL's, and 68882's for oxidation....

I downloaded the info on Claes Holmerup's page about modifying your Falcon for more reliable SCSi and bassboost, line input, etc.
Then I went to a local electronics shop to purchase the resistors and capacitors and discovered a bewildering variety! Wattages form 1/8 watt to 20 watt and more, voltages from 25 volt to 400 volt! I am not doing the actual soldering as I don't have enough experience, and the person doing it knows nothing about atari or the falcon(maybe he doesn't need to?)

But I feel sure that _someone_ here has done these mods, so would you help me out here by letting me know what wattages I need, and what voltages?
If it helps at all these are the items I need:
1000 mF
470 mF
100 mF
15 Kohm
4.7 Kohm
1 Kohm
10 Kohm
1.8 Kohm

47 ohm
82 ohm

also, although I was able to get a 74F04, they had no 74F08's
he suggested a 74LS08, would this be an acceptablesubstitue for the 74F08?
thanks for any help here folks!!

But parity is ignored by everyone, isn't it? At least in the old days, 9-bit
SIMMs were only of particular interest to PCs.

>>The problem on the SIMM becomes a problem for the user.

>If the SIMMs are broken, bring them back to your dealer.

I'd really like to see what they would say if I brought back to them a SIMM
which worked fine in all of their machines due to it malfunctioning in a PS/2 or
Atari.

There was a German card containing an ST-clone with an '020 processor, but I
bcan't for the life of me recall its name. Gemini? No, that's a desktop.
Nejon? No, that's a plant. It's a roman deity. With two faces. Think...

Aha!
It was called Janus!

Hi  Everyone!
        I  am  new  to  this  News Group ,but  not to  the Atari.
        I  am  trying  to  get  my  4Meg  STE  onto  the  Net,using  STING
with  X-control.
It  appears  to  load  Serial.Cpx  and  Sting.Cpx  OK and also  the
required  4  STX  modules.
However, it crashes  with  4  Bombs (Illegal  instruction) and  prints ; DNS
cache  load  failed.
although  it  also  prints  out ; Sting  version  1.02(01.00) installed.
I  think  it  maybe  unhappy  with  the  Default.Cfg  file.
As  I  am sure  you  know  with  Atari  it  is  always  the  last  bit  that
takes  is  most  difficult!

Any  ideas  will  be  most  appreciated !

                                            Vic  Pearson.

Hi Ken,

Usually a shared scsi ID with different LUN is common for drives sharing the same controller, and no I DON'T mean the host adaptor. All the scsi drives I've seen have onboard electronics so usually the lun is 0 and a different scsi id is used.

Ken Macdonald wrote:

Delete the cache.dns file, it may be corrupted. Another will be created once online.

Hi Peter

>Just what is the definition of a device as far as Ataris are concerned?
>Theoretically it should be anything addressable by software, I guess,
>including printers, scanners and the screen etc.

I believe this would be the correct definition.

I understand a device to be a link to the outside world, be it a hardware/software combination, e.g. a graphics card and the software that drives it, or a piece of software that drives a port in a specific manner that an external piece of hardware requires/understands, i.e. a virtual device.

Devices could be printers, plotters, scanners, VDU's, cameras, robots, propietry measuring equipment.

```

I took a few looks at that project but have put it on the backburner.

I might be mistaken, but I was under the impression that the project required SMD
components, so you'd need to know what package sizes were involved (such as
0805), rather than actual wattage ratings?

Anyway, to answer your specific question 1/8th Watt resistors would be more than
adequate for this purpose - if you get 2 or 5% tolerance you'll most likely find
that you'd get better channel matching.

Don't know about your IC question I'm afraid.

> out here by letting me know what wattages I need, and what voltages?

The resistors and capacitors for the audio modification are surface mounted (SMD) and they have numbers corresponding to their size rather than the power rating. The original components are 0805, I think, but you could do with 1206. (I made my modification with 1206 because that was what I had at home.) The 1206 are a little bit bigger.

> also, although I was able to get a 74F04, they had no 74F08's
> he suggested a 74LS08, would this be an acceptablesubstitue for the 74F08?
> thanks for any help here folks!!

The F-series has a typical delay of 3ns per gate and the LS has 9ns per gate.
The closest in time is the ALS (4ns) and S (3ns). The S has a power consumption of 20 mW per gate instead of 2 mW for the LS, 4 mW for the F and 1mW for the ALS. Pretty much any of these should do, but you never know. We are dealing with clock pulses here.

You could also go for the HCT (8ns) that are suggested in some drawings of the clk-patch.

My suggestion is get two with different delay time and if one doesn't work try the other.

The 47 ohm and 82 ohm resistors are for one version of the clk patch I think? These could and could not be surface mounted. It depends on what the person doing de soldering prefer.

Good luck.
/Jonas

Does this mean that I have to use surface mount? I hope not.

thanks. so it looks as if the ALS at 1mW and 4ns is the closest. He
probably
won't have that one! Murphys Law :-)

Yes. On Claes Holmerups web page, there are 3 mods mentionned. the 47
and 82 ohm
resistors are part of the third mod.
thanks for your help Jonas and Derryck! and thank you Claes also.

I did that multiple times - if it's broken, they get it back, no matter if
it will work in *some* machines. Same goes for partially defective or
unsuitable (3.3V) SIMMs, which also "work" in some machines.

For a startoff I'd suggest trying the latest version of STinG from:
http://sting.atari.org

Grab the updated modules for the archive at the same time.

The only config file which could have a bearing on your problem would be the inf file which points to your folder with the modules and dns cache file - if this wasn't right then you won't see STinG's report that it's loading its modules as it loads from your auto folder.

Might also be worth deleting (or better, renaming) the dns cache file and let STinG rebuild it (ignore the error message for starters).

First get the latest version (1.26) from Ronald Anderssons homepage:
http://www.ettnet.se/~dlanor/sting/html/index.htm

IIRC there was as problems with the DNS cache file
and if this was deleted the problem was solved.

In that case, there's no need to worry, I suppose.

No. All atari expansions as well as the STs with SIMM sockets *ignore*
parity.

Is it even possible to browse the web on an unmodified 1040ST? If anyone can/does do it, please let me know the following:

1) How can I hook up my 1040ST to my Amiga 1080 monitor's RGB port? (i.e. what pins go to what pins) and/or how do I hack my 1040STf to have composite out? As for the latter route, I would appreciate instructions in English. I speak/read no other language.

BTW, paying $10 for the 1080 was a steal for me. It works flawlessly! YES!

2) What is the maximum data throughput for the 1040ST's serial port? (i.e. what is the fastest modem it can handle?)

3) Are there any mods that will allow the 1040ST to have faster video output? Larger floppy drive (1.44Mb), Hard Drive? Faster CPU? Etc.

Perhaps I'm being silly for trying to do something really useful with such an antiquated system, but... that's the fun of owning a $5.00 1040ST... you can afford to tinker with it.

Which brings me to my final point:

If anyone (or anyone(s)) are interested in trying to create the most compact ST motherboard design possible, I will gladly donate my 1040ST for parts and study. And if someone should, somehow, make it better, faster, and more usable... GREAT!

All you need to do is pay postage to ship it... wherever.

Jared

the maximum throughput of the ST's serial port is 38400 baud (i think)
but it can be upgraded to 115200 baud so u could use a 56K modem

>

yes... go to http://atarihacks.cjb.net for info on upgrading.

Thanks for confirming my understanding. Problem is that a HYP and manual that I am adapting, originally written by Joe Connor, uses 'Device' where it seems only a drive or drive partition is meant. After your message I have revised it with an explanatory note.

I've at least run CAB on one, while not online.

>1) How can I hook up my 1040ST to my Amiga 1080 monitor's RGB port? (i.e.
>what pins go to what pins) and/or how do I hack my 1040STf to have composite

>I speak/read no other language.

IIRC, the 1080 has got a standard SCART/Peritel connector. See
http://chimo.unimo.it/~vezz/atari/hardware/zip/monitor.zip

>BTW, paying $10 for the 1080 was a steal for me. It works flawlessly! YES!

Isn't that model particularly radioactive?

>2) What is the maximum data throughput for the 1040ST's serial port? (i.e.
>what is the fastest modem it can handle?)

Out of the box 19200 bps, more with patches such as HSMODEM.

>3) Are there any mods that will allow the 1040ST to have faster video
>output? Larger floppy drive (1.44Mb), Hard Drive? Faster CPU? Etc.

Certainly. Have a look at http://atarihacks.cjb.net/

>Which brings me to my final point:

Oh no, not again.

>If anyone (or anyone(s)) are interested in trying to create the most compact

>All you need to do is pay postage to ship it... wherever.

How grand of you. I believe that everyone here know of cheaper ways to find an
old ST. Besides, there have already been more compact ST MB designs, by Atari
themselves. When will you RTFM?

Take a look at http://bales.online.fr/atari/.
Think you will find all necessary links there in section 4.
I don't know if you are able to use STinG, maybe :
try also once : http://gallery.uunet.be/saka/atari/lan/router.htm

Hope this helps.

I think we have found the culprit. The majority of ST games are not written
for a b/w display.

In German mags, I keep seeing PS/2 SIMMs mentioned everywhere. Is this German nomenclature for bog-standard SIMMs or do they actually mean the particular IBM-type SIMMs for PS/2 machines with size detection lines?

I think so. After loking at it, I designed my own SMC Ultra->VME adapter which basically works the same (ie. Ulrichs original driver works with my adapter), only in a more optimized hardware design. The adapter works fine in my TT with the TU Wien TCP stack, however, because the TU Wien stack is outdated (I fixed several bugs and got it working under Magic some time ago, but upgrading my server to a newer linux verision broke it again), I do not use it currently.

There is no *single* "standard" SIMM. SIMMs are standardized ba JEDEC, and there are several flavours.

Most common are the old 30-pin and the newer 72-pin (aka PS/2, since IBM started using them first in their PS/2 machines).

Most atari RAM cards I know require correctly wired detection lines, but since JEDEC requires these, any SIMM that lacks the detection lines can be considered broken, even if most PCs and the Milan ignore them.

Hi All,
I would like some suggestions on what wouldbe the best route to take to re-case my Falcon. I want more space so that I would be able to install a 3.5" IDE hard drive and an internal IDE CDRom drive.
I'm thinking either the DeskTopper case or the MarkX case.
Any suggestions?
Thanks,
Sam Ferrer

hi,

now for another of my many, many questions:

I have software which copies the TOS ROM onto disk.

I was wondering if I could burn this copy into EEPROM and manage to fit
it into my STe.
is there any software/way of doing this if it is possible. I heard
someone had wired TOS 2.06 into his Atari ATW800 workstation.

Hi,

just wondering which is the most powerful between the Falcon and TT
since they are both based on the same processor.

cheers,
Marc

Well, 95% of all SIMM-using hardware will use the same type, as long as the number of pins is the right.

>Most common are the old 30-pin and the newer 72-pin (aka PS/2, since IBM
>started using them first in their PS/2 machines).

Mind you, IBM PS/2 machines won't use "standard" 72-pin SIMMs, but require particular 72-pin SIMMs with speed and size detection lines which are not in place in the SIMM you commonly buy at the computer shop.

>Most atari RAM cards I know require correctly wired detection lines, but

I'd rather consider the Atari cards broken, since they then refuse to accept all SIMMs I have, spare for my 2 precious IBM ones.

The TT has a 32-bit bus and a double-clocked CPU, so in this respect it's a lot more powerful than a Falcon. The Falcon has much better graphics and 16-bit stereo DMA-sound though.

Perhaps 95%, but you can still find SIMMs that aren't of the correct type,
the VSIMM for Mac LC is 72 pin and doesn't work, same for a HP 700-series.

Well, then those SIMMs are cheap crap. I have Kingston memory, and that
works just fine (and they were bought in a common computer shop).

I wouldn't say broken, they just conform to the standard. If your SIMMs
doesn't work, then just fix them! Most of the cheap SIMMs that aren't
wired correctly have a couple of solder pads on them so that you can wire
them however you feel like. Just use a solder iron and be done with.

Not to forget its DSP, which enables the Falcon to do things the TT won't manage, like playing MP3s at a decent speed. Of course, you need special software that supports the DSP.

Ciao

Thomas

I thought the VRAM SIMM was 68 pins, but that was perhaps GVP SIMMs. And the
IIfx SIMMs.

Well, Kingston builds SIMMs for most every system produced on Earth. They even
make monster DECstation SIMMs.

True, but it doesn't sound like my favourite pastime.

Hi there,

Marc Wilson wrote:
>
> Hi,
>

> since they are both based on the same processor.

Thats where the similarity ends...

A standard Falcon clocks its 68030 CPU at 16MHz, while a standard TT clocks in at 32MHz. The TT also has faster RAM access, due to wider (full 32-bit) access to memory. The Falcon system bus only uses I think 24-bits of the full 32-bits bus to access memory. Even if the Falcon CPU was clocked at 32MHz (mine is), the TT will still run ordinary software faster due to its memory access advantages.

If you use the DSP in the Falcon however the table turns somewhat. As an example I've timed depacking of JPEG image files on an STe, Falcon, and TT. The Falcon depacker used its DSP and was about 50 times faster than the STe, and several times faster than the TT.

Other aspects draw comparison too, with the TT losing out on graphics and sound capability to the Falcon.

Both are still good machines, but the overall feel of speed would go to the TT I believe, with the Falcon winning on graphic and audio stuff...provided of course you are talking 'standard' machines, as both can be upgraded significantly!

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

The Falcon is a 16-bit design, with a 16-bit data bus and a 24 bit address bus. It's actually a STE with a crippled 030 and some goodies (like the Videl, SCSI-controller, improved DMA, 16-bit sound and a DSP), while the TT is a real 32-bit design.

> Both are still good machines, but the overall feel of speed would go

Another thing to consider if you have to choose between these is the fact that the TT is a lot more stable and reliable design than the Falcon. The Falcon is flimsy and delicate, while the TT just goes and goes forever. It has better and more reliable SCSI, more serial ports (nice when you want to connect a modem, a Palm and a mobile phone to the same box...), more RAM (up to 256Mb I believe) and excellent support in MiNT, MagiC, NetBSD and Linux. And it has a very good keyboard. Definitely the best ST-compatible box Atari ever made.

First it's illegal to my knowledge as it's piracy, putting TOS on your own EPROMS, but you can try, try as hard as you want because there are a lot of differences between 3.0x and 2.06.

3.0x has come from the TT and the TT has the 32bit bus, and the ST has 16 bit. Parts would need seriously modifying as big bits from the TT are missing in the ST.

It would save you a lot of time and money and effort to get Magic/Mint or Geneva, and TOS 3.06 ain't that much differnet or better than TOS 2.06.

I've got both and find that although the Falcon is better at graphics, and of course, audio playback, the TT is far faster running other things like DTP and MIDI apps....hardly surprising really, the TT was designed as a workstation and the Falcon was designed as an home multi-media computer.....

It would be easier to find someone with a TT with TOS3.06 and get it
copied direct from their ROM's....it's still illegal though, and it
won't work cos 3.06 is specific for the TT, though it was bodged into
the various clones....all ATW800's have TOS2.06, it's there to boot the
Mega STe that forms the host for the transputer boards that then run
Helios (Unix-like transputer OS).....

I'm trying to get my Matrix COCO to do 1024x768 in monochrome, and need some advice on how to set up the driver to do it....also I'd like to run 1024x768 in 256 colours....it has a meg of memory so it should handle these easily enough...I'm using a Panasonic 19" Pana Sync 6G monitor...

Hi Folks..

My TT has a Catch Computers TT Ram board in it. It has 8x 30-pin SIMNM slots on it. When I got it there were 8x1Mb SIMM's in it, I've changed them for 8x4Mb SIMM's, but it still only seeing 8Mb....there is an 8-switch DIP-switch to set up the board and I guess I need to change them to suit the new size....anyone know how as I didn't get a manual with the machine....

There maybe some jumpers you have to move around. Thats the way it is on the Atari version.

Um - no. There are a lot of machines that require parity, and your el-cheapo
simms which do not even conform to the standard in terms of presence
detection pins won�t have parity, either.

Furthermore, there are such variants as 33-bit, 36-bit (without single-byte
write capability), 40-bit etc., which are used in workstations.

Some IBM machines require such special types instead of "normal" PC-style
72-pin SIMMs with 32/36 bits.

>particular 72-pin SIMMs with speed and size detection lines which are not in
>place in the SIMM you commonly buy at the computer shop.

Then these SIMMs are broken by the standard.

>I'd rather consider the Atari cards broken, since they then refuse to accept all
>SIMMs I have, spare for my 2 precious IBM ones.

I have lots of SIMMs that work fine in my Atari ram cards.

The MagnumTT card has jumpers as a workaround for broken SIMMs, but the problem is clearly on the SIMM.

No. I reworked it for an easily mass-produceable version, which was never built and tested, and do not have the original sources (for the one PCB i made and which now sits in my TT).

However, unless someone goes ahead and writes a MiNT driver for the card, there is no use in publishing the thing: if you really want to build one, you can use the original docs by Ulrich Roehrl (sp?).

cu

Jared Falvo wrote:

> The Neotari Phoenix computer is [GOING TO BE] a GEM2000-based computer with the following features:
>
> 1) PowerPC 603e CPU

why not a more upto-date cpu, you could even do a range, the 603e, 604, 620, G3, G4 like the Celeron, Pentium III and Pentium III XEON?

the old DEC Alpha's are getting as low as �45 for 366MHz (second hand of course) and that is capable of destroying the Athlon and Pentium III with it's TerraFLOPS technology while the G4, about 5 generations ahead of the 603e, is measured in MegaFLOPS. The Alpha is just as incompatable of the 680x0 cpu as the PowerPC

> 2) GEM rewritten for PowerPC and upgraded
> 3) Internal IDE port (no floppy port)

why use IDE if you can use SCSI like the MegaSTe, TT and so on......?

> 4) LS-120 drive (doubles as 1.44Mb floppy, if necessary)

do people really need the LS-120 or the newer SuperDisk? why not just give them a CD-R or CD-RW drive, costs the same and CD-R media has more capacity and can be read on just about every computer with a CD-Rom drive.

> 5) Two DIMM slots
> 6) 2x AGP slot
> 7) Three or four PCI slots

how about a VME slot or two for old stuff or ISA so techies can rewire VME for ISA

> 8) Audio card (vender yet to be established)

why not a range of audio cards?

> 9) Video card (vender yet to be established)
why not a range of video cards

>
> All PCI/AGP cards installed will be soldered in place to insure permanancy
> and security. Tampering voids warrantee.

what's the point of having SLOTS if your going to stop people from using
them? i.e. if someone wants to upgrade their system in future?

You're still at the dreaming stage so take one step at a time, warranty
is the last step before the machine leaves for the shops.

>
> The exact same hardware will be installed in every system to insure
> consistancy.

well it sounds like its a dull system then...... a graphics artist will
pay ������������s or $$$$$$$$$$$$s more for a fantastic sound system
they'll never use or musicians will pay ����������s or $$$$$$$$$$s more
for super graphics that they'll never take advantage of, why not tailor
them to the user.... after all you have to sell them to the individual

>
> GEM will be ported to the PowerPC chip and upgraded to be Y2K-compliant as
> well as improved overall, thus rendering it to be called GEM2000!

great lot that's gonna do when it's 2001. GEM is old hat, why not give
it a new name and use the inspiration from that MIDI your listening to

>
> An Atari ST emulator will be written for GEM2000 and included with every
> system. This will allow Atari ST programmers to rewrite their software for
> GEM2000.

if it's an emulator, then why would they have to rewrite their software?

>
> In the end, the Atari era can be reborn with no more concern trying to
> upgrade old Atari systems to the modern era, which is nigh pointless. It's

the PPC 603e isn't very modern, why not jump to the PPC 620, G3 or G4?

> time to accept the loss of Atari and all it's systems (clones included) and
> begin anew, while maintaining the essence of the Atari spirit in Neotari
> Corp. and the Phoenix I computer, using a revised GEM.
>
> Any Atari programmers, developers, ST users, interested in this vision?

> pushing a dead horse a few more feet down the road. Let's take GEM, rewrite
> it for the PowerPC processor (isn't GEM written in C? Mighty portable code
> from what I hear), and start a new computer system, made by a new computer

GEM isn't opensource like linux, i.e. u cant get hold of the source code
or modify GEM as Digital Research still owns it.

> company. Atari ST users can enjoy running their old software via emulation,
> and ST programmers can rewrite their ST softwares to work with the new GEM.

that's gonna be hecktic, all those millions of different programs having
to be re-written? why not stay backward-compatable?

>
> In the end, you have the same look and feel of GEM as the Atari ST's had,
> the same software (if not also new software and games!). The only

Hi,

anyone know any published (i.e. paper not electronic) Atari mags that
are still being published? last I saw of ST Format was about 2 or 3
years ago.

bye,
Marc

As far as I know, ST Applications is still being published.

I however hear about another paper-based Atari magazine....... ;)

If you have a 1040 with an RF modulator connector in back, then the composite video is available at the monitor connector. If not, then a hack is needed or an adapter built/purchased.

Games don't have a good track record when it comes to respecting system
software calls. It might work if you'd like to run DeLuxePaint or something
like that, but not for games.

Parity as opposed to EDO? That's true, I suppose I haven't been following the developments lately.

>Furthermore, there are such variants as 33-bit, 36-bit (without single-byte

The problem on the SIMM becomes a problem for the user.

1) Get an emulator. I suggest either PaCifiST, or WinSTon (or one of
its successors, known as STew)
2) Get MAKEDISK. This comes with the full distribution version of
PaCifiST, but is available separately.
3) Use MAKEDISK to read your ST disk images into a .ST image file.
4) Use these image files in one of the emulators.

The Swedish /Atarimagasinet/ has been around for 15 years now. It's a
quarterly magazine and no. 3/2000 just went out to the subscribers.

Subscription/membership fee is SEK 175 adding SEK 50 if outside
Sweden. Check http://www.sak.nu/ for details.

I have a Matrix Coco in my MSTe.

Even though it has 1mb of ram, I don't think that it will go much past 832x528 in 256 colours. The (Intel) processor on the card appears to use the ram for other storage as well.

Apropos of nothing much... it is posible to get the Coco to tick over slowly enough to drive a CGA monitor. I can get ST Medium, 640x200 on my Atari SC1435 in 256 colours with the Coco. Not particularly useful, but pretty.

Hi all,

I think the answer's no can do, but here's the question:

I have a Falcon, bog standard, with a GT5000 scanner and GTLook2
attached, and a
Milan 40, bog standard, no cards except graphics. I use the Milan most

times for
Interneting, using MODEM2 at V90. BUT, it would be nice if I could
couple the two computers together, eg to download a mpg3 with the Milan
and pipe it to the Falcon for playing there, or scan in a picture on the
GT5000 and pipe the TGA to
the Milan for use in Da's Layout. At the moment I have to break up
>1.4Meg files into bits and transfer them on floppy. I have heard of using a null
modem cable,
but the only usable serial port on the Milan is taken up by my modem. Is
there any other way?

Thanks in advance.

Bob King.

The Milan has three serial ports: one connected to the MFP (only recommended
for debugging output), plus two 16550-style ports with 115200bps and FIFOs,
so you can use one of them for the modem and one for the connection to the
falcon.

Hi Michael,

yes I know about the other uart port. When I bought the Milan it hed
came the ribbon connected from the mother board to the wrong socket and
no way could I drive the output, Serial 1 I think, so I reconnected and
have used MODEM2. The other port seems dead. I have the other uart
HSMODEM driver, but still no go. If there is any that I can get both
high speed ports to work, then please tell me. . Milan give special
drivers on their web page, but yet again I can't get it to work. And as

for setting up STING!! X-Control, which allows you to change STING.CPX
etc to set the baud rate, doesn't work on the Milan and Z-Control which
does work on the Milan, cannot change the CPX. If I want to change
anything I have to use X-Control on the Falcon and copy the changed CPX
to the Milan!!
The serial port implementation on the Milan seems to be a very poor
afair.

Thanking you for your advice in advance,
Bob King.

Sure there is. Get PARCP and connect the two using the parallel printer
ports. You and download the program and make the cable or else you can
order an already made cable from the author like I did. There is even a
version that will work on the PC's included. Excellent program. Check it
out at: http://users.zln.cz/~pstehlik/home.htm

We had this one a while back. The ROM chip was loose. Had to open 'er up, remove the RAM board and press down on the rOM to put it all the way back into it's socket. Re-asseble and hasn't missed a beat since.

Greetings,

I'm looking for an ethernet card for the TT030, anyone point me in the
right direction for one?

Also, any good URLs with mods, accelerators etc. etc. ??

TIA

You need HSMODEM: first DRVIN, then UART-3F8 and UART_2F8 for the two accelerated ports.

Or you can use MiNT and Frank Naumann�s serial port driver for mint, which seems to be most trouble-free solution.

cu

 Hi Michael,

 Thanks for your feed back. I have and use the two uart drivers you mention, see
my
 posting you quote. I have also tried the Naumanne driver. Perhaps it's because
 the Milan is one of early one's, constructed from the Mother board up by Joe
 Conners that the other modem port seems dead. I am going to try the inter-
parallel
 port idea given me on this NG. If it works wow.

 Bob King.

You'll have to watch out for cases with ATX power supplies though. They need a wire held low to make them work, so you'll need to replace the non-latching switch at the front to a latching type.

I'm going to be working out how to control this by software soon, by possibly using bit 15 of the Yamaha PSG as it's reserved on the ST. Not sure about the Falcon/TT though. It's a very simple design really.

A shutdown program like ones with Magic and Mint could turnoff the computer automatically. Mint would be easier to do as it's open source.

Substation could have been really good. The graphics were quite poor, but then if you think about it they did a really good job of getting the most out of the STEs hardware.

It does have one the best front ends to a game I have ever seen an STE, pushing the DMA sound to it's limits.

Not sure what the Falcon version was like but on the STE it's all greyscale, so it's very confusing. It's almost impossible to remember if you've been to places before or not!

It would have been nice though to be able to select certain extras for graphics so people with faster STE's could use better graphics, that didn't slow down the gameplay. Bit like MCsofts Power up, demo is available somewhere on the net.....

I know, the TT has an ATX PSU. You can still use the non-latching switch
if you use a latch or flip-flop to control the PSU. This makes it easy to
control the PSU by software as well.

Yes a though about that, but do ATX power supplies supply 5v all the
time? I know there is a wire on mine that says 5vSB. I suppose I
should check with my meter. I'll fiddle around one day.....

Hi Derryck,

Yes cops does work on both platforms, but am I weird YES you yell, in hating
all that clutter, all those crossed out icons. Smacks of the uneccessaries!!!

Back into my cave again.

Bob King

Hi,

Does anyone know anywhere i can find diagrams or instructions on using
ISA or E-ISA PC cards on an Atari ST or TT?
Also, is it possible to upgrade the TT's 68030 CPU to an '040 or '060 or
something along those lines?

cheers,
Marc

Try to find a file "SMC*.ZIP" (I believe it was called SMC1.zip but am
not sure).
This file describes an ISA to VME interface used for connected an SMC
based tehernet
card. It will work with other cards as well.

You need to get the data sheets for each product and all the information you need to work it out yourself will be there. Some may also have application notes which give worked examples of basic projects but that's it.

If you mean has anyone devloped a DIY project, I don't know.

any ideas as to where to find the file? :)

cheers for the info,
marc

>all that clutter, all those crossed out icons. Smacks of the uneccessaries!!!

That is definitely a big drawback, agreed. I also cannot make it function as an installed app for running CPXs from other filepaths than the one configured.

Did you try the recent version of ZControl BTW? I know it addressed the Y2K problem?

Hi Derryck,

didn't even know there was one!!! As I said, main problem with ZControl
was that
it failed to update the internals os STING.CPX (or is it SERIAL.CPX)
with the new Baud rate when you click on Save. Another thing to note is
that if you use
Starcall, it seems to over-ride everything else and force 19200 on you.
Hellish to remove!!

Bob King.

Hi,
I have a 1040ST with a number of games (on floppies) that will not load.
Any suggestions? Please e-mail to:
Christopher Keegan
ck@eclub.com.au
Also I'm looking at selling this machine and wonder what it is worth. It has
a SM124 b&w monitor no hard disk. Any ideas? I'm based in Australia.

Hiya

Firstly, if you request help in a newsgroup, expect to read the group for your answer as other users may benefit from the help given:)

What games are you having problems with?

99% of software should run OK on a standard 1 meg machine, about 90% will run OK on a standard 4 meg machine.

The only problems I've encountered, when it comes to memory matters, is that some programmers forget that the screen address changes from 1 memory config to the other! I know I've done it myself, when I didn't have a 1 meg machine to test on! It is bad programming, and I think most programmers slip up a little when they first start playing around a little:)

You can get around this minor problem by using a program that fools your machine in thinking it's a half meg machine.

Incidentally, if you have the 'Ultimate Ripper' cartridge and switch it on BEFORE you turn your machine on, enter the cartridge and then switch the cartridge OFF while pressing the reset button. ALL the Atari's I've tried this on REVERT to half meg machines! VERY handy.

I don't think it works if you've got the bug ridden version that comes
with Supermon!

Not knowing the titles, I am groping at straws and only presume I'm
answering the correct problem.

```

Um - no. It may work with *some* cards, but it is specifically tailored to
the needs of an SMC Ultra Ethernet card and is no general ISA interface.

It's a well-known bug. I suggest looking out for that later version - I've
just tried it quickly and it seemed to save the setting.

Hi Derryck,

I have downloaded it and its running. Before I made SERIAL and STING.CPX read only, every time I changed configurations in my AUTO file or run certain Comms progs. they used to rest to 19200!!! Now I have them protected. I will back them up and try the new ZControl. All my thanks, this is what this group should be about, see some of my soapboxing on comp.sys.atari.st!!

Very good Ger>Eng single word translator by Ralf Zimmerman, goes over the top a bit with phrasal suggestions, but complements GEMTRADE nicely.

Hi,

Does anybody out there have the Mk X case instructions.
I have fitted my Falcon in such a thing. But now I want to make the line
level patch to the sound system. I remember that the Mk X case fitting
involved changing/removing some sound resistors since it has the cinch
connectors instead of the miniplugs. But I can't find the instructions
to check if it was something important.

Regards,
/Jonas

The best solution is a TT ram card that takes PS/2 SIMMs. The AixTT or the
newer MagnumTT should still be available, eg. from Woller Systeme.

The AixTT can take up to 2 32MB SIMMs, the MagnumTT up to 2 128MB SIMMs.

Hi Jonas,
I have, or at least my son uses, a MKX C-Lab. If he does n't erupt at the
thougt and you give me precise details of what I am looking for/at, I could undo
the case.

Hi Derryck,

Did you try on a Milan, I have just done so and same as before, it not only does
not alter
SERIAL.CPX, it turns the settings for MODEM2 to 19200, no response. Good thing I
made aback up!!
Could well be a bug in either SERIAL.CPX or some part of the Milan's OS.

Bob King.

Basically I did it like this (http://atari.nvg.org/stacyram/), except
that I didn't remove the original RAM. Perhaps this is the problem?
Since I "tap into" the address-lines between the resistors and the
original RAM it could be that the load on the address-lines is too
high. I'll try to cut the address-lines between the resistors and the
original RAM tonight and see what happens.

That should not be the problem - I installed several ST RAM expansions that way, even with the old ones (with 1MBit-DRAMs) this was usually no problem. Now with the minimal load that a modern 4MB SIMM produces, you should have ample margins.

You're right, I just tried it but it didn't make a difference. Perhaps
I've damaged the SIMM :-(

If you mean 32-bit SIMM 72-pin SIMM, then it should work. Done it many times.
When debugging, it usually helps to disable upper two megs and try with one bank only.
Recheck wiring on all address lines on SIMM, then check RAS&CAS wirings.
I did manage to mix-up RAS/CAS line between banks. BTW, have you properly disconnected old RAS/CAS lines and tied them to Vcc ?
One more thing, connect GND with more than one wire to SIMM.

Regards,

Branko

I have the opportunity to buy a 1040ST for $5.50 (US dollars). It doesn't have a monitor or mouse. What I need to know is, are there mods available to make the 1040ST usable (in color modes) with an SVGA monitor, like my 15" Sony E100. As well, is there a way to reroute the wiring in a two-button PC serial mouse to make it work with the 1040ST?

I know that they say that the monitor has to be able to do 15Hz Horizontal in order to do color modes (the lowest mine goes is 30Hz), but is there any way to accelerate (or whatever) the horizontal signal from the 1040ST so that it can display color modes at 30Hz?

Jared

Either Lacescan from http://www.sting.org IIRC, or the less comprehensive
OverScan (from various ftp sites etc etc). Both are good, but aren't
suitable for the STe. They're much better bets than tweaking pots, because
they actually turn the useless black border into usable working area.

```

Hi Derryck,

full agreement, DIY overscan comes with driver and raster contering/adjustment software, almost essential for your ST or STFM, but make it switchable. Easy to do, even I managed it :))

Bob King

Hello There
For some time I have had startup problems on my Falcon 030. When I switch it
on
the Harddisk and the rest of the machine doesn't start. If I press the reset
button for
5-10 seconds the machine normaly starts, but some time I have to switch the
Falcon and
press the reset button a lot of time to get the machine to life.
What's wrong ???

I have had the machine for 6 years now, but it is only the last year this
problem has appear.

Thank, Preben Sloth

Are there schematics for this version somewhere on the Net? Wherever
I looked, I found only schematics for the version with linear PSU.

Beside different power supply the newer version has a different
horizontal stage- with a chip instead of discrete transistors, and there
seem to be other differences. At least my monitor is like that.

cu.

Hi Derryck,

I'm sending Carl my overscan.zip, driver, circuit diagrams and txt files, but
can't find the adjustment program. There was one, wasn't there. The MegaST4 with
it in is not conected so can't tell?

Bob.

I need to know how to connect my 1040ST to an A/V-capable TV (you know, the ones with the Yellow, Red and White RCA jacks?), if at all possible. Are there other video modes (S-video, RGB, composite, etc.) possible by tying certain pins together on the monitor port?

Any and all help, greatly appreciated.

Jared

I've had the same problem a few times. Loose socketed chips have been
the suggested culprit, but I haven't opened her up to be sure.

Good luck with your search.

Hello.

Keychange Music Services, (in the UK) +44(0)1925 266120, have or can find spares for most of the Atari computers. I will post anywhere in the world if required.

Cubase v3.1 brand new also in stock.

Ring or email your needs.

Barrie.

>readme.

Yes, you are right. HP Optimizer shifts all the data to the end, so there should have been nothing at the beginning other than perhaps the partitioning info etc. and I find it hard to understand why he got a 'gap'. With DE you had the option of moving all the contents to beginning *or* end which was optimum for reading and writing respectively IIRC.

From HPO's README:
OPTIMIZE places data at the end of a partition, so that TOS has faster access when searching for free clusters. This could result in a message from another optimiser that the partition optimised by OPTIMIZE was not, in fact, optimised. This form of organisation has the additional advantage that, with regular use, files that don't change are pushed to the end, and the optimiser then has no need to touch them again.

Regards, /Peter/

Newsgroups: comp.sys.atari.st.tech

The Neotari Phoenix computer is a GEM2000-based computer with the following features:

1) PowerPC 603e CPU
2) GEM rewritten for PowerPC and upgraded

3) Internal IDE port (no floppy port)
4) LS-120 drive (doubles as 1.44Mb floppy, if necessary)
5) Two DIMM slots
6) 2x AGP slot
7) Three or four PCI slots
8) Audio card (vender yet to be established)
9) Video card (vender yet to be established)

All PCI/AGP cards installed will be soldered in place to insure permanancy and security. Tampering voids warrantee.

The exact same hardware will be installed in every system to insure consistancy.

GEM will be ported to the PowerPC chip and upgraded to be Y2K-compliant as well as improved overall, thus rendering it to be called GEM2000!

An Atari ST emulator will be written for GEM2000 and included with every system. This will allow Atari ST programmers to rewrite their software for GEM2000.

In the end, the Atari era can be reborn with no more concern trying to upgrade old Atari systems to the modern era, which is nigh pointless. It's time to accept the loss of Atari and all it's systems (clones included) and begin anew, while maintaining the essence of the Atari spirit in Neotari Corp. and the Phoenix I computer, using a revised GEM.

Any Atari programmers, developers, ST users, interested in this vision? Instead of trying to force ST GEM/TOS to work on ST clones, thus merely pushing a dead horse a few more feet down the road. Let's take GEM, rewrite it for the PowerPC processor (isn't GEM written in C? Mighty portable code from what I hear), and start a new computer system, made by a new computer company. Atari ST users can enjoy running their old software via emulation, and ST programmers can rewrite their ST softwares to work with the new GEM.

In the end, you have the same look and feel of GEM as the Atari ST's had, the same software (if not also new software and games!). The only difference is that it's not an Atari ST or Atari clone and isn't trying to push an outdated OS and technology where it can't go. Drop the old baggage and let's start fresh!

I'd love to see this realized and I think a lot of other people would too. A dream is the spark. Let's add some kindling and get this dream off to a roaring, flaming start! Hmm?

"Think not that anything is impossible or it will be. What is mere thought can be true reality. What is true reality can be used."

Jared (listening to the MIDI version of the Klax soundtrack... very inspiring!)

Does HP Optimizer shift clusters used by directories to the end as well?
If it doesn't, that could explain why there was something at the
beginning.

AFAIK all overscan drivers enter "adjusting" mode if certain key combinations
are pressed during bootup. <Left Shift> or <Ctrl> <Shift> or <Alt><Shift>
or something like that. BTW does somebody have some "autoswitch" overscan
driver (i.e. the one that switches on/off automatically for various programs)
that he would be willing to share? Or was the "autoswitch" version commercial?

Cu.

Can anyone help me locate one of these . Iam running SMPTEtrack on a 1040st and
would like to have this to use program at it's full potential.
Maybe you know what I could use in place of the midiplexer or

the specs to build one myself. I hope someone has the answer out
there

I was wondering if anybody knew if published directions existed on how
to make an adapter so you can connect a PC keyboard to the ST
motherboard.

Thanks.

Hi Steve.

You have a point of course, and I stand humbly corrected, but you tell me how
you can shape a metal knitting needle into either a blade or hex without a great
deal
of deliberate (suicidal) determination and in any case I saud not metal earlier.

Hi Peter,

You are correct of course, there it is in the README. Must learn to read these things. The authors take the time and trouble to write them, then I ignore.

Why not just buy a genuine Atari Mega keyboard from Keychange, at �25 plus post it's cheaper and has all the keys in the right places, and an Atari mouse works with it. I'll post it anywhere if necessary.

Barrie at Keychange.

hi
I am helping out a friend(Aage Nielsen,
exec member at large of TAF)
install an extra SCSI drive on his TT.

rather than go to the effort and extra
expense of using the external
SCSI port, I thought of just adding the
second drive to his internal SCSI
cable. We can take out the existing
cable and replace it with one that
can accept two drives, the cable is long
enough to go out the back to the
second drive, and provide power to the
second drive.

my question is can we have 2 SCSI drives
on the internal SCSI bus?
Can they be separate SCSI ids (i.e. 0
and 1) or can they have the same
SCSI id, but different LUNs (i.e. LUN 0
and LUN 1)
Thanks for any help here

ken

Yes, sure. The internal bus is not really different from the external bus. It's just on the opposite side of the cabled, that's all.

> Can they be separate SCSI ids (i.e. 0

You have to use different SCSI IDs, just like with external drives. You can't use different LUNs with hard disk drives except with hard disk drives where one controller on the drive controls more than one drive. I don't know any SCSI hard disk drive where this is the case.

AFAIK, one can even use a cordless Logitech keyboard and mouse with that
adapter.

OK!
thanks a lot for the help Uwe.
I metionned the LUNs as I remember reading old
ICD or SpectreGCR manual they would mentions LUNs.
although, like you, I have never seen any jumper settings
or drives that would set LUNs.

That version of Overscan used different hardware than the PD version, so I
doubt that it would work :-(

I do have my original master disk, even though the hardware itself is long
gone.

There should be no reason why not.  I'm going to buy myself an optical
PC mouse for my Mouseburster sometime, because the ice mice I've got
(2UKP!) is absolutely rubbish.  Can't draw a straight line on a
graphics program to save my life!

Just because it's cordless it shouldn't mean the commands are
different, just the way it get's from A to B.

Hi

I am in need of an Atari Falcon 030 case as the model I have is fitted
within a Lighthouse Tower case and this no longer is suitable for me.

I am UK based

The only drive I've ever found that makes effective use of different
LUN's is the Panasonic PD650 which uses LUN0 for itself when it is a
650Mb MO drive and LUN1 for itself when it's a CDROM drive. You need HD-Driver with the <Check for seperate LUN's> option checked in Advanced
settings, and you need SPIN to drive the CDROM side of it....and you
need to have a PD650cart in it when it boots up.....

Hi Ken

Yes but mine was a 250MB Zip under MiNT, so it couldn't be to big,
hasn't had time to look into it. My brother has borrowed the drive
and it's working, so there must be some misconfiguration on my part.
But if you get it to work, please let us know how.

I think it is really a simple sytax error in a path:
Example:
oops:\foo.bar

I managed this once on a logic 2.0 song file
many years ago: it took days with a pencil and paper
and a hex sector editor.
Gemhexed I think.
Good luck ;-)

The quickest way to wreck your filing system is to use Diamond Edge on
a LFN partition.

Hi Derryck,

Point taken, but I don't use long file names. Never felt the need to go beyond the 8.3 format. Smacks far to much of the 'we have got the memory, processing power, etc, so lets increase the data input and bring

the overall speed, utility, etc back to where it was before', mentality
that has caused Windows to be the mega/gigabyte eating/demanding self
perpetuating memory monster that it is.!!!

Bob (troglodyte) King

Well....the answers I got is that this info is property of Stienberg,
and you would have to contact them to get it. YIPS! they don't listen
to any Atari-Users anymore. Sorry I could not help further.

Tim

Hi

It looks like I've got to do this the HARD way:(What I could really do
with is a legit copy of Cubase if someone has a copy to give away. It
may help in the file build! and anyone else in the future!

```

I just found a page dedicated to all 68k-based architectures and their hardware. There is a page dedicated to the Atari, but it is really thin on information, but perhaps would someone care to enlighten the webmaster?

The URL is http://www.angelfire.com/ca2/tech68k/

Hi Derryck,

I've just been using HD Optimizer to defrag a couple of partitions. It does
the job OK, albeit with none of the graphical guidance of what is happening
to each sector that DI gives you, but, and this is a big but, on both partitions
sorted, it left a large middle part of the partition empty, whereas DI shoves all
data to
the beginning. This means surely that new data on the partition is going to stored
in this
middle gap, with more probablity of defragging, than with DI, where the new data
will be
tagged on at the end?
As I said before, if I ever feel the need for greater than 8.3 file names I may
change, but for now I'll stick with DI, thanks again

Bob (troglodyte) King

Don't be silly. "Long" files names are no overhead at all. Even the C64 had
longer file names than TOS, and there is no excuse to stick to such an archaic
format when the rest of the world (save the PC) has had "long" file names for

the last 20 years.

I have an old atari 520 st fm for sale with matrix dot printer, mouse, joystick & lots of software. The single 'a' drive which is not working. Anyone interested in it please e-mail me back before the end of next week. I'll take a fiver for it for the lot or it goes down the tip. Location: southern England. Rgurney@tesco.net

True many machines used long filenames, they use their own file
structure NOT the structure used by TOS and MS-DOS. YOu only have so
many bytes before the file info comes along (length, start cluster
etc.).

Hi Bob

>Do you still use long file names and if so what is the advantage?

I /only/ use LFN's, the advantages are that for instance you could use a more descriptive filename for your DOC files, picture files, folders, etc.

Hi Hallvard,

>Anyone have either the schematics for the CartMaster itself, or can tell
>me how to modify it for LEDs for each port?

I personaly would be looking for a chip select for each port, i'd buffer it and
drive a
LED with that line.

Doh!, hey Homer, LFN's add nothing to system overheads and in some instances simplify things.
Its easier to find a template doc with the Filename Rent_Cover_Note.PAP in a folder
string of E:\Document\Personal_Self\Housing_Rent\Rent_Cover_Note and then

saving it as Rent_Cover_Note_08_10_2000.PAP.

Hi all!

I've just replaced Extendos with Spin! v0.34. All works brilliantly, including LFNs and I can access a Windoze95 cd I couldn't before.

However I've got a question.:

When I put an audio CD in, Spin!'s doc mentions being able to get .WAV files for each track and PRG files to play them. However I only see the latter.

I think that this is something to do with the BOS driver (I'm using Spin!'s SPIN_SD.BOS). Unless it's to do with the hardware in the CD-Rom.

On a PC at work, NT-Explorer sees .cda files (only 100 or so bytes in size) which I assume is the equivalent of the PRGs (I think this is done by the BOS driver), and not .WAV also.

I'm looking to convert a track from audio CD to MPEG (either on Atari or PC) for a musician friend's website - http://www.impala.co.uk - (legal for his CD), so can someone suggest a program either on PC or Atari that will enable me to copy a WAV format track from CD? (I've got an MPEG encoder on both platforms)

BTW, I've also got hold of a Cumana CD Rom (external) that is supposed to be SCSI, but the cable that comes out of it doesn't have a normal SCSI-1 or 2 plug on it (I think it was originally used on an Amiga) anyone know if I can use it?

Cheers!

James

Hi Steve,

sorry about my previous posting, I think its QED, it sometimes becomes unstable and insists on outputting a string of hashes. What I meant to say is that it's easy to see why Diamond Edge has this problem, its just that I have yet found the need for long file names. The other Steve has reminded me of the ability to more exactly describe the contents of images, docs, etc. Of course he has a point, but until I feel the need I'll stay 8.3

Bob King

>memory, processing power, etc, so lets increase the data input and bring
>the overall speed, utility, etc back to where it was before', mentality

Installing MagiC (and NVDI) would completely transform your system. Not only does MagiC allow multitasking, it's also a re-write of TOS in optimized code. Programs actually run faster. Add NVDI for snappy screen updates and vector font support...

Have I convinced you to come out of that cave yet? :-)

I'd guess that no-one has the schematics in that case :-(

Presumably there are some chips inside the switcher, perhaps there is a chip select line or similar that you could hang a Darlington driver and LED off of?

I don't know all the ins and outs, but shifting data to the start or end of a partition optimizes it for reading OR writing, depending on which end the data's shifted. I'm pretty sure that there's some info on this in the readme.

True, but adapting a corrupt system from the beginning is no excuse. In particular not when designing a new system in 1985.

Not to mention what would happen to my MP3s. Even file systems with 30
character limits are displaying their weakness in that case.

Hi Iggy,

I see you are a Transformer fan, best sound track to a film ever, still have Optimus Prime!! We annoy our son (25) by playing the death of Optimus Prime track and bringing him in under a white sheet, Prime not our son.

Pity you use an Amiga Off-line reader though, although it does give some brilliant sign-offs.

Bob King.

>I'd guess that no-one has the schematics in that case :-(
>
>Presumably there are some chips inside the switcher, perhaps there is a
>chip select line or similar that you could hang a Darlington driver and
>LED off of?

That's what I've been thinking.

There will be some lines in the cartmaster to select which cart to use, but it depends if they're accessable. (they could be internally inside the chips, probably PLD or something)

I'm thinking you could use a pin on each cartridge port. Maybe ROM select 3 or 4? (pins 31 and 33) The LEDs will flash, but they'll flash so fast that it will be unnoticable; it'll look like they're on.

I don't have the cartmaster so I'm not really that sure of the circuit. And I don't know that much about the cartridge port.

Best way is to experiment with an LED wired in series with a 270 ohm resistor, and prod about!

I have an old (aren't they all?) 520ST. Serial # A1 1014297 7 1985, I only mention the serial number because whenever I used to take it in for service, the guy would always marvel "Wow, this is one of the originals!". Or something along those lines. I had the TOS in ROM upgrade done and then a year or 2 later I had the Meg memory upgrade, so it's actually a 1040ST now.

Since I can remember, It's had this problem where you have to let it warm up before it would boot up. Until it had warmed up you would just get the little bombs across the screen. I had taken it in a few times but they had never fixed it. So today, for fun, I dug it out to see if I could get it working. It hadn't had power on it for at least 6 years, and then probably not for 4 years before that.

So I plugged it in and turned it on and same thing, bombs. Let it warm up for half an hour and it works. Just like 10 years ago. So I got my "Super Cold 22" spray out and started shooting. When I hit U15 with the cold, bombs. If I hold my soldering iron over the chip and blow on it for a few seconds, it starts up after hitting reset. So I need to replace that chip. It's branded:

C025912-38
JH23-019
6B4 36

I can't find it at http://www.freetradezone.com/ or anywhere else for that matter so I'm just looking for advice and where to go to get one of these chips. Maybe someone here has an ST salvage yard and they'd sell me a chip?

I've tried re-seating it. The chip is bad.

Does anyone know where to get one of these chips?

Thanks,

Glen

Use special rubber or superfine sandpaper to clean the contacts on IC. With a needle carefully bend all pins on socket to press harder on chip when inserted and clean them too with a bit of sandpaper.

I don't think the chip itself is bad. Symptoms you described point to bad contact due to oxidised pins rather than a bad chip. While at it, do the same with GLUE chip (CO-25915), but take care NOT to swap them ! If you insert the MMU into GLUE's socket and vice versa and popwer up machine, you will fry both chips !

One more thing to watch are corner pins on the chip. When socket presses on the chip, corner pins on the chip can sometimes touch underneath the chip. You have to bend them accordingly.

Regards,

Branko

>I have an old (aren't they all?) 520ST.

I don't know about serial numbers, but if it has it's TOS on ROM then
it's not one of the first machines.

IIRC I remember seeing an advert/info detailing some of the features,
including ports. The FIRST ones had a tape port next to the serial port
and edge of the machine.

What makes this memorable was an article that was curious on how long a
tape program would take to load!

OK. To be in accordance with what you
say, it seems that TOS only
pretends to access my SyJet cart. Since
there is a 1.0 GB limit
under TOS, Magic, BigDOS or MiNT, when I
partition my SyJet cart
under TOS-DOS this means that I can only
create one 1.0GB
partition on my SyJet 1.5GB cart!? as I
am restricted to one
partition/drive(cart) under TOS-DOS.
Seems a shame to leave 500MB
unformatted(unpartitionned0! :-(

hmmmm. methinks you do not underSTand!
:-)
When I partition a drive under HDutil
for TOS-DOS compatibility,
I am only allowed ONE partition!
Since TOS won't recognize more than 1GB,
I effectively have
to throw away 500MB! blecch.
otherwise 2 750 MB partitions work for

me also! :-)

They are internal.

However, besides the usual high-voltage warnings when messing around inside
monitors, beware of a common mistake: in the newer SM124 units with
switch-mode power supply, there is a pot "B+" (in the power supply) which
seems to be able to increase the horizontal size - and which decreases the
remaining lifetime drastically.

The real H-size adjustment is done by adjusting the core in one of the
bigger coils in the h-deflection circuit. V-size is a pot, however, to
really use the full screen, you may have to readjust the centering with the
magnets on the CRT, the available pots are usually not sufficient.

Long file name and large partition support - DE can't handle either.
With my 840 MB partitions DE gives negative numbers for sizes etc,
crashes when you try to display the fragmentation map - so I certainly
woudn't trust it for a defrag. Also HPO seems to give a 'cleaner'
optimisation, although it hasn't got all the facilities that DE has.

What's the easiest way to disable the original RAM in a 1040ST? I've cut
the RAS/CAS-lines and connected them to Vcc via the 68Ohm (I
think) resistors, but this does apparantly not work. Atleast I can't get
the 4Mb SIMM I soldered in to work...

Hi again,

I'm sure I'm teaching Grandmother to suck eggs (a weird english saying), but do not use a metal screw driver to adjust pots. Same thing hppens if you put metal inside microwave!!!. Shaped knitting needle may do in extremis.

There is also a small adaptation to the ST's circuit to give overscan. I may still have it somewhere. My MegaST4 has it switchable, very good.

It might be worth your while to touch up the socket's solder joints, could be that there's a dry joint there.

That should be sufficient, so I guess you should check if the connections to the SIMM are all OK (and if the DRAMs on the SIMM are connected in the necessary way for an ST).

If you are good at soldering there is an article (probably on the net) that
I read which describes a procedure that will result in an increased screen
size...

The update is usually for v5.5 to 5.6 which covered the 680x0, I do have
v 5 & 5.6! what I can do is compare the 2 packages for you.

Steve,

Thanks Id appreciate that. I know they added quite a bit of stuff for the Falcon, but there is nothing on this in the manuals, they cover the standard ST/STe APIs.

Atari 1040 stf Emagic Clab 3.1 Unitor SMPTE

Here is the entire MIDI studio recording package: Atari 140 stf with Color Monitor, C-lab 3.1 emagic software with the SMPTE/MIDI add on the Unitor. In addition to SMPTE the Unitor includes 2 additional MIDI ins and outs. With the Atari, equals a total of THREE sets of MIDI ins and outs/ plus the SMPTE time lock capabilities. It all works perfectly. OVER $3,000 of goods. Will include misc. Atari Software. I have the original Atari boxes and zippered case for Clab Unitor - Shipping $50.00 US only.

Has anyone managed to get an IDE CDrom working on a Falcon? I have tried with metados and Spin but no joy. I know the drive is setup as device 17 (IDE slave), but no amount of coaxing seems to help it. I wondered if the ISO9660 drivers etc were of to old a version.

Hello,

I own a TT and a SM124 monitor. I wonder if it's possible to connect it
the the tt and use in 640x400 mode? It seems that the only thing to do
is to adjust amplitudes of signals as the frequencies should be the same
for both monitors. Am I right? Maybe anoyne has done the trick?

stay cool,

Kylo :-)

They are not - the TT is designed to drive a VGA monitor, with the
corresponding timing. You might be able to hack a SM124 to the required

frequencies, but that might not be simple.

Hi,
I�ve got a problem with my sequencer programm LOGIC (by emagic). Can someone
give me information about drivers for the printer HP 610c? I�ve got real
problems with printing scores in logic. What is the correct driver and where
do I get it?
Thanx a lot,
Sebastian

Have a look at the latest ExtenDOS update. It may be able
to handle that as they added SCSIDRV support as well
as ATAPI/IDE support. Please check it out carefully
as I would not want to miss-guide you in a purchase.

I would like to have a go at Spin, seems a lot of people have managed to set
it up. I just need to know what drivers are needed as well as the Spin
Software.

Mark

It's not the ISO-drivers (DOS-drivers) that's the problem, but the
hardware-drivers (BOS-drivers). It's possible that someone has managed to
get HD-Driver to emulate a SCSI CD-ROM *and* managed to get Spin! to
recognise it, but I doubt that. I've tried everything imaginable but it
doesn't work.

You need a BOS-driver that works with ATAPI-drives, that means

```
CD-Tools. It's possible that ExtenDOS has one too, but I don't use
ExtenDOS so I can't say for sure.

This has been working for quite some time now - I use this setup regularly
on my Milan, under TOS, MiNT and Magic.

IIRC, HDDriver is the only driver whose SCSIDRV works with ATAPI devices so
that you can use Spin on them.

I've got it working with my STE, so it would be a similar operation to
working it on a Falcon. I have a document (I wrote) in HTML
describing how to do this. Email me if you need it.

So how do you configure Spin! and HD-Driver then? I get HD-Driver to list
the device at bootup, but Spin! can't find it. This is a rather old
Samsung ATAPI-device, SCR-631.

I got mine working (under TOS 2.06) with HDDriver 7.8(supports ATAPI
drives) then used the BOS driver from Spin! and DOS ISO9660 driver
from Metados. I use the Metados programme to load up the drivers.

All works except for audio CD's that say data on drive is damaged, but
installing Mint gets rid of that problem.

This is exactly the problem I am having. HD-driver can be set up to bleat
about the primary IDE slave (device 17), but spin just dosent see it? I have
tried 3 different working drives, 2 Panasonic and 1 Payless...

Hi all

Well the subject says it all, what's TOS error #46?
I seem to recall, having seen a list somewhere on the net, containing
all error codes. Doe's anyone know an address?

Jo Even Skarstein (joska@nvg.ntnu.no) wrote:
: It's not the ISO-drivers (DOS-drivers) that's the problem, but the
: hardware-drivers (BOS-drivers). It's possible that someone has managed to
: get HD-Driver to emulate a SCSI CD-ROM *and* managed to get Spin! to
: recognise it, but I doubt that. I've tried everything imaginable but it
: doesn't work.

I have configured a system exactly as you describe and it works fine, and
I know of several other people doing the same with my IDE interface. I
imagine that if you are having problems with it, this would be caused by
a configuration error and not a fundamental flaw in the system.

On the Belgian ftp-server you can find a small hypertext file about TOS errors

ftp://chapelie.rma.ac.be/ataridocs/hypertext/toserror.hyp (2.449 bytes)

Spin needs a SCSIDRV-compatible low-level driver for your drive, and HDDriver is the only driver I know which supplies this for ATAPI devices.

You have to enable the SCSIDRV interface in HDDriver, enable the CD-ROM
device's ID, and then tell Spin! to use that ID (IIRC it is device number
16-19 for primary master/slave, secondary master/slave in the spin
config.sys).

HMMMM...There are several file formats for Cubase: ARR/ALL/PRT/DRM/IPS
and even MID! Which one.???.not that I know anything about it! However
a "WHY" might be in order to see what you actually want.

Tim

> Thats just the demo version i take it, with all the import modules excluded!!.

Yep.

And industry experts are worried because it consumes less RAM than it occupies on disc. The full version will actually be smaller than the betas. Rumour has it that it will also run 25% faster - which, as we all know, wouldn't be true, would it?

I don't think too many partitions is the error. Are you using NEWFATFS?
Can it be you use very large partitions (>2 GB)?

CU

Hi

Good point, not having used Cubase I was unaware of the range of formats
used:) The format I need is for the .ARR files.

Cheeers!

Hi

With due respect! you didn't make anything clear in your posting!!! Did you!!!!!

Mind you if you read the program you may learn a few things, like support software authors and companies that are keeping our beloved machines alive:)

Pirated Serious software WILL damage the Atari programming industry. The author of HD Driver, the best hard driver package available (in my opinion), has already stated that if people continue to use pirated copies of his software, he WILL STOP improving or writing it.

Writing decent software takes months, even years, it's NOT like you see on the TV or in the movies, a quick few taps on a keyboard and you can program a satellite to change in to a spaceship.

```

If you mean GEMDOS error -46, that's Invalid drive specification. There is a list in Mark Baines' The Atari A-Z, whichis available for download as shareware (sorry don't know site).

Hi Martin

Not using NEWFATFS on the drive in question, it is a Zip so the partition isn't to big (250mb). Could it possibly be damaged terminators? Have been using it connected to a Powerbook, and there where some strange behavior, it suddenly couldn't read a disk. So I figured I should connect it to the Milan and test it. Tried Zip Tools on the Mac and it reported no errors neither on the drive or disk. But Mac OS couldn't read the disk. Time to put it in the trash?

Hi Pascal

Nope don't think so, it's a Zip drive and I used it before. For more
info on the problem, check my answer to Martin.

Oh yes, comp.sys.atari.st is certainly the place to be for warez wannabes,
making evil pirate copies of programs which ceased development half a decade
or more ago.

I recently got a load of cheap Amiga mice (HiSoft are selling them at batches of ten for �25), and since I've got no really good ST mouse, I was wondering what an adaption would entail. i'm not particularly sensitive about altering one mouse directly, although I'd feel more safe creating an adapter (it's not as messy=). Is it just a matter of switching some wires, or are there any electronics involved?

Port of NVDI5 lib for GCC
Does anyone have this? Has anyone attempted doing this? If you have any information on this, please share it with me. It would really mean a lot to me if there is already something like this available. I need the support for the new GCBITMAP structure (24-bit non-planar graphics, etc...)

Hi Steve

I guess I am trying to understand what you mean by "format". For example: What is SAVED when you save an ARR file from cubase? These would include things like stuff in the Inspect window,patch changes, and sysex material you have on a track. Then you could taker several ARR files and put them together to form a .ALL file or rayher a song which contains many arrangemets.

Or are you talking about if you bring a file into TXT editor: what is
there?

HMMMMMM...perhaps if you tell us WHY? Why do you need a "format" on
ARR. then I can try to understand what you want.

Tim (thinking too much!)

I would like to invite anyone of you to the Atari-midi mailing list.

Are there Joliete drivers avaliable?

Well IIRC the 'former' LAPD PD library was authorised to sell some of
their products, so I'll check up for you what sort of deal and hopefully
get myself authorised for distribution for some GFA products:)

Hence buying through me will aid the Atari community:) and just maybe
encourage other software production.

I'll keep you posted!

>snip>

If you can get at the boot sector with a monitor application, such as
exists in Harlekin.Acc, you can make sure the very first entries are

```
(in hex):       EB 34 90 49 42 4D 20 20
which read as:   .  4  .  I  B  M space space
(where the dots represent characters above 7F hex, 127 dec).
Some of my disks start with: 60 38
others have:   60 1C 90 4D 53 44 4F 53
which read as:  `  .  .  M  S  D  O  S
```

I believe, but am not sure, that only the first 4 hex characters are
really needed. Maybe someone can confirmn or correct this suggestion.

>In a related topic, I can't read the zip and syquest Atari-formatted
>cartridges with my PC either... My ICD link is dead (my Atari number two
>died at the same time), the cartridges were formated using ICD software,
>maybe there is the reason... My syquest EZ135 died its ugly death too, I

Though I use an EZ135 too, I can't offer help on this. The cartridges
were factory-formatted. But HDDriver partitioned them and made each
cartridge my alternative boot disk.

Cheers,
Charles.

I don't give a bloody damn about copyright law, it has been stated quite a lot recently that it harms development. There is a bloke in Sweden who's become quite rich through a patent on colour graphics, and what about Amazon's patents?
The fact is, I fully comprehend copyright law, I just don't agree. What the former GFA developers are doing is called "squatting".

>I won't waste my time talking to a child.

Oh, please stop, isn't it rather childish to lower yourself to this level?

I find this amazing. You claim you are an Atarian blah! blah! blah! and
you slag off Mr _lp whom is one of the people that still supports the
Atari.

He has a RIGHT to bring up copyrights etc. If it wasn't for people like
these you wouldn't have had any software in the first place..

and regarding GFA, if it had more support from people paying for the
software instead of stealing it things may be different!

Without it nobody could earn a living from a product. And development
normally costs much more than you earn in the first few months after
a product appears on the market. But better not think too much
about it because than you'd maybe would stop feeling so cool for
not paying for the software you use.

Gerhard

This is by far not sufficient to make a hard disk PC compatible. The
most important differences are not these bytes (they might even be not
relevant at all) but the partition map layout and the boot sector
layouts.

Hi Mark,

In so far as I understand Spin and its english translation, I think that
it caters for Joliete. I will confirm when I am home away from this damn
PC.

The ISO driver supports it, but you'll need Magic/Mint to handle
it. Might be something to do with the filesytem, but I don't really
know. Might be a bit like using Audio CDs under TOS/GEM.

That's all I can offer Mark.

Hi everyone!

Could someone please explain how the 8bit DMA sound works on STEs.

I've been looking at schematics, but the digital data for the DACs
comes from the Shifter. Not where I expected.

Does the DMA fetch the samples from the RAM then pass it onto the
shifter to send to the DACs? I really need some help.

I'm particually interested in how MOD files are played. How are 4
tracks achieved? Does the CPU combine the 2 left tracks to 1, because
the DMA can only fetch two samples at a time (L and R)? Or am I
wrong?

What would be really helpful is someone who can take me through the
process of playing a MOD step-by-step.

Thanks in advance!

Hi Mark,

as promised here's an extract from the Spin doc.

SPIN.XFS - A Level-3-driver for MiNT

this is a MiNT-file system for CD-ROMs, the on the MetaDOS-BOS-drivers set(s) up. It can so under `Plain-MiNT', multiTOS , N.AES Or other MiNT-compatible(s) AES-versions einge-places becomes.

The XFS supports different file system:

- ISO9660 Level 1 (the "normal" format)
- ISO9660 with "long" names (becomes to the eXAMPLE with Amiga-CDs uses)
- ISO9660 with Rockridge-extensions (from this extensions becomes certainly only a part evaluated)
- ISO9660 with Apple-extensions (Resourcefork, Type and Creator)
- ISO9660/Joliet: the Windows-95-format, the conversion the Unicode-character(s) in filenames is certainly still not ge-tests)

Trouble is I think you need Mint to use Spin.

I don't know this mysterious Mr. _lp, and have never intentionally "slagged"
him off.

>He has a RIGHT to bring up copyrights etc. If it wasn't for people like
>these you wouldn't have had any software in the first place..

He certainly has the right, but why bother, now that he has washed his hands
of GFA (I suppose we're still talking about the GFA developers)?

>and regarding GFA, if it had more support from people paying for the
>software instead of stealing it things may be different!

No amount of legally bought copies of GFA BASIC for the atari will change
anything now. It is that simple, and quite apparent, if you weren't as
dogmatic.

Did you even read my previous messages? I do pay for the software I use, I
just refuse to pay for software which isn't developed anymore.
As for regaining development costs, in the fast-moving computer world, that is
done in much less than than the 75 years or so that copyrights now reach
beyond the death of the holder. But that is beside the point. I don't think
that copyright law is a kind of higher moral, but rather a law dictated by
market forces and rather irrelevant to the case of GFA BASIC.

After Peter kindly sent me diskmod.tos everything worked fine right on... It is so fast, it is magic...
(; 7)

I transfered 38,6 megs of Notator files, more than 14 years of Atari-made music... That means that will take months just to listen to it... And some people think musicians don't work hard... Peter thank you very much, you putted this big smile in my face...
(: 7)

May I send you a midifile by email from my song "Upstings"? I am a brazilian composer with an italian nickname and living in Paris France, we live in a shrinking world...

Now you have one more chapter of the "This newsgroup changed my life" tale...
(; 7)

Next, I will transfer all this avr samples (around 150 disks) done with my Replay 16 to the iso cd rom too, and after that I will convert everything to wav... I don't like the idea of all my work going to Data Heaven... Time to back up, my friends... DD disks are not being sold around here any more (bad news for my MC 500 MK II Roland too), the same is true for syquest drives and cartridges... If you want to keep using it, back up everything first... You will feel waaaaay better... I do...
(:; 7)

Iso cd roms will be around for 5 years, at least, dvd drivers can read them...
Tomorrow I will try Gemulator Explorer, then I let you know....

Many thanks again, from a happy brazilian composer

Hi Derryck

I know, it was just that I had Spin.doc in german and Gemtrade to hand so voila there you are   ---- not so good as your translation, but then I'm a lazy so and so.

Thank you, Uwe, for your contribution (invaluable, as always),
but might I point out that what I suggested does make my Atari disks
(I think we were talking about floppy disks: was I mistaken?) readable on
a friend's PC and also on my Mac. I have no idea why.

Hope you had a good holiday :)

Charles.

I have a 1040ST. It needs a monitor to work.

Is there anyway I can run it through a normal TV, perhaps by using the a
SCART adapter ?

i have 2 different types of 1224 monitors, one has the monitor cord
built into it, the other has a monitor cord that plugs into the back of
it, the one that has a seperate cord seems to give off a much more
vibrant resiloution than the other.
the colors stand out much better, but it has a problem on certain
programs, it likes to roll on some, but not others.
i can adjust the rolling with adjustments on the back, and at the bottom
of the monitor it says 60mgz, but why do i have to do it at all?
also i am used to 8-bit monitors that fill the entire sreen, why is a st
monitor letter boxed, it would be nice if you could fill the entire
screen.
i use a mega 4, or a stock 1040 on this monitor in case it matters,
thanks,
lance

Isn't that called ringing?  Or is that a little bit of ghosting?

Technical Advice Notice 00001, 1 June '86 recommended, on an as-
required basis, changing C109 through C113 from 470 pf to 22 pf, if that
is what is happening.  The 470 pf was excessive capacitance for some
cables, on R, G, B out and VSYNC and HSYNC.  You seem to have ghosting
and VSYNC problems, and this might help.

hi

I have some TOS-DOS formatted SyJet cartridges, and when I try to view
them in MagiC 5.11 on my CT2bFalcon I get a TOS error -46.
Yet, in normal TOS (CENTEK 7 or 4.04) there is no problem opening
the drive window, same for MiNT(w/ n.aes).
Why can't MagiC view my TOS-DOS SyJet(1.5GB) cartridge?

I can copy to and from the cart in TOS or MiNT, but I can't use
Kobold2.5
to do so as it reports incorrect sectors, AFAICR
another puzzle. I would have thought Kobold disk handling would be more
capable than Ataris??

maybe I need Kobold 3.5? (even if it is in German!)
ken

I am cross posting this as I don't know if this is a hardware/tech
problem
or a software problem.

That may be possible, but if you could get ahold of a Video Key, that would
definetly allow you to hook it up to a TV.

The tech note said "as required". I have not worked on the 1224, but on a bunch of SM124s. For those, there are horizontal and vertical size adjustments on the main board, and then you adjust magnets to get the display rectangular again. The problem with "fixing" this is that you lose linearity, which is important for some applications. On a color monitor, you have a lot of magnets to adjust, and they all affect convergence as well as pincushioning and tilt and such.

And there are also overscan programs and hardware, which I know nothing about, but Systems Solutions in England sells hardware for this, which works on some machine types and not others, and may work for monochrome monitors only. The have e-mail, and will answer questions, if you want to go that way.

This is a feature of the ST, and can only be fixed with additional
hardware and software. Take a look at http://dlanor.atari.org (IIRC) for
the excellent shareware-alternative Lacescan.

The ISO driver (ISO9660F.DOS) does not support Joliet, hoewever there are
several XFS drivers for MagiC and MiNT which do (see for instance
http://www.muenster.de/~reschke/soft_e.html#spin).

Hi

Diamond Edge is STILL a commercial program, I may have a copy knocking around for sale though:)

TOS partitions larger than 1.5 GByte are illegal. The maximum size for a
TOS compatible partition is 1 GByte.

> another puzzle. I would have thought Kobold disk handling would be more
> capable than Ataris??

What would you gain if Kobold could handle larger partitions but the
rest of the operating system couldn't?

Hi Ken,

I'm a bit puzzled about your statement that 'your better of with ....
HD Optimizer.'.
I downloaded it, but no way can it compare with Diamond Edge, even the
early version I have. I have used it for ST, Falcon and Milan for
partition optimization/defrag and undeleting, with no problems at all.
I am obviously missing something in HD Optimizer, but what???

Bob King.

Actually, the TOS-DOS partion is slightly under 1.5, It is something
like
1.46GB. TOS can read the SyJet, as can MiNT-n.aes w/Thing. It is MagiC
that can't read it!? Is there any reason you can think of for that?

> > another puzzle. I would have thought Kobold disk handling would be more

I don't understand what you are saying. It seems to be the opposite of
what I am saying! :-) I am saying that since my operating system _can_
access
the Syjet cart, why can't Kobold?
I can access it under TOS, and MiNT, Why can't Kobold? Perhaps Kobold
can't
handle the sector size?
I don't know, I don't understand this whole problem!! :-)

I've got a legitimate copy of Cubase v2.01 I want to get rid of....I'm
looking to swap it for a legit version of Zero-X v2, or any other GEM
based program that can handle SCSI sample transfer from Atari (pref
tested with TT or Falcon) to a Yamaha A3000 sampler....Cubase v2 only
works on ST's up to Mega STe...I've used it for years on an STFM
(2.5Mb, STf (1Mb but it's a bit poky, you have to not load some bits)
an STe (2Mb, 4Mb, TOS1.62 and 2.06) and a Mega STe (TOS2.05) and it's a
fine and reliable peice of software.....if it worked on a TT I wouldn't
be getting rid of it, but I'm shifting to a TT and Cubase 3.1 for
sequencing now so my old copy (you cannot get the v2-3 upgrade
anywahere these days) has to go....fully boxed with a manual and
dongle....just need a smaple transferrer....doesnt' even need the
editing facilities of Zero-x....just the SCSI trasfer....

I own Edge, but I am no more using it for years, as it can't manage with partitions either then standard, and I love too much that long filenames in Magic.

What is a video key?
And Scart works fine, and gives a really crisp image. The trouble lies in
finding or building the cable.

Do you mean bindings for the new VDI functions in NVDI 5?

> Does anyone have this? Has anyone attempted doing this? If you have any

The latest Gemlib has full support for NVDI5. I've successfully used
GEMlib pl38 with both GCC and PureC.

Is it possible to copy Atari discs using a PC? Also can one convert the data to PC format (its a database with ASCII and integers)?

At the moment if I insert the Atari disc, the PC tells me its not formatted.
An older 286 machine tells me its empty.

Sorry if this is the wrong group - I've never needed to work with an Atari before!

>HMMMMMM...perhaps if you tell us WHY? Why do you need a "format" on
>ARR. then I can try to understand what you want.

What I'm after is the format the file is saved in: the header of the file and where/what the segments in the file are.

Very much like an executable program file has to be in a certain format for it to be run; the header which contains all the info for the data, bbs section etc..

I am trying to recover a disk that has nothing but .arr files on. It looks as if the .arr files have header or pointers for the various sections of the file; much like tracker mods etc.

If I can find the start of the file, I want to be able to work out the length (or be very close to it). I will then be able to try and suss out where the other bits of the file has gone, hopefully.

So in a nutshell I am after the header info that tells me where the relevant sections are leading to the total length of the file!

Don't you mean comp.sys.atari.st.tech as that's the group I'm reading.

It may surprise you that, IIRC, C++ may not have been available for the Atari 5 years ago!!

The point is that, unlike the Amiga where piracy is rife and seems to be the preferred medium, obtaining pirated copies, NO MATTER HOW LONG AGO IT WAS, has an effect on the people who STILL write software, upgrades and many other supportive roles for the Atarian!

If you are copying COPYRIGHTED material, it doesn't matter what your excuse may be or how old the software is, you are PIRATING software which is ILLEGAL. Unless the copy if a backup copy of something you already own.

For example: I'm trying to obtain the rights to a couple of VERY useful programs, hopefully to improve on the and add more features. Now for me to do this it will cost some serious cash! Will my work be rewarded, or will I have wasted my time for it to be pirated!!!! and then I have to ask myself a question? do I try and save other quality pieces of software from being sent to the dustbin of time?

So in essence you may not be stealing from me, BUT from every Atari user by preventing the software that may be available to them!!!

One more thing, I USED to be classed as a pirate (although I classed myself as a hacker), so whatever excuse you can think of I've already used it.

I've written software which had taken months to do only to have it, and the sales, torn down due to piracy.

I still believe that if the software is good enough to be used regularly then it should be obtained LEGALLY, even in the 'piracy' years. If it isn't available new, then buy a second hand copy, you should get a manual and you can still help support your Atari and it's community.

```

No it's the right area for this newsgroup:)

This is the MOST frequently asked question or problem, I think we are
running at 2 a week a the moment.

You can have your pc to read disks formatted on the Atari, you can also format a disk on the pc and your Atari will read and write to it.

DO NOT use 1.44meg (HD, high density) disks in your Atari UNLESS you've had one fitted. The data is UNSECURE on them.

I use a program call DC Format 3.0 to format disk on the Atari to transfer small files between the 2 machines.

You can download a copy from LaST PD's web site:

www.last-pd.co.uk

anyone hording updated eproms for the various atari's?

i need the raw image not an actual eprom, i like to burn them myself.

some url's perhaps?

just raw images not hex is needed, i'm looking for any useful upgrades i can do on my atari's

any models also.

ch.

What!?! This is great!!! Somehow I missed this.... I am certain it will
be easy to find it on some of the ftp sites, but just in case let me
know where you got it from.

Thanks a lot :-)

Hi steve

Looks more complicated then I thought. So have you have tried loading these into Cubase, and they do not load? Or are you somehow trying to convert them to midi files? If you want to zip them to me at tconrardy@hotmail.com I can bring them into Cubase and convert them. (which is he only way to convert a Cubase arr into a midi file)   I did try taking an ARR file into a TXT editor to see what it looked like. Just code to me. I am not a programmer. perhaps you need a programmer. however, if the above is true, feel free to send me the files and i can convert it. If you have a PC, you can get GEMEXPLORER to read the files onto your PC HD.

```
Hope this helps a little

Tim

Some clarification is needed:

[...]
>Spin needs a SCSIDRV-compatible low-level driver for your drive, and
>HDDriver is the only driver I know which supplies this for ATAPI devices.
>
>cu
>Michael

Indeed HDDriver makes it possible to access IDE-drives asif they are
SCSI.
But there is a stand-alone prog that is called scsidrv.prg for
supplying these functions without the need for HDDriver . (Please
correct me if I am wrong!).

Met vriendelijke groet,

Hoopla, I wasn't lookign carefully enough. =)

>It may surprise you that, IIRC, C++ may not have been available for the
>Atari 5 years ago!!

No, but it is very much free now, or have I misread the GPL?

>The point is that, unlike the Amiga where piracy is rife and seems to be
>the preferred medium, obtaining pirated copies, NO MATTER HOW LONG AGO
>IT WAS, has an effect on the people who STILL write software, upgrades
>and many other supportive roles for the Atarian!

Oh yes, it certainly has an effect on the people who STILL write GFA BASIC for the ST. I'll take your word for it that they have resumed work on it after how many years' silence and officially discontinued development?

>If you are copying COPYRIGHTED material, it doesn't matter what your
>excuse may be or how old the software is, you are PIRATING software
>which is ILLEGAL. Unless the copy if a backup copy of something you
>already own.

Or if I copy it from my friend or brother.

>For example: I'm trying to obtain the rights to a couple of VERY useful
>programs, hopefully to improve on the and add more features. Now for me
>to do this it will cost some serious cash! Will my work be rewarded, or
>will I have wasted my time for it to be pirated!!!! and then I have to
>ask myself a question? do I try and save other quality pieces of
>software from being sent to the dustbin of time?

The problem is, that so much good software alrwady is sent into the dustbin of time, such as GFA BASIC (I'm not implying that that in particular is a nice piece of s/w, not having used it), and thus the only realistic way of obtaining it is through a pirate copy.
The GFA developers have, by discontinuing development, implied that our money isn't interesting. Certainly, you may buy it from Falke Verlag (IIRC), but please tell me why. It is a discontinued piece of software.

>So in essence you may not be stealing from me, BUT from every Atari user
>by preventing the software that may be available to them!!!

If GFA BASIC is uploaded to some FTP or WWW site, it is very much available.

>One more thing, I USED to be classed as a pirate (although I classed
>myself as a hacker), so whatever excuse you can think of I've already
>used it.

And I used to pirate moderately - I preferred PD - when I was young and poor. Today, I have some money and support software which I use, but there is no way to support discontinued software, it is just as good as throwing money out the window. Save that money and buy some /new/ Atari software which is still being developed, and you will further Atari development a lot more.

>I've written software which had taken months to do only to have it, and
>the sales, torn down due to piracy.

And your point is?

>I still believe that if the software is good enough to be used regularly

>then it should be obtained LEGALLY, even in the 'piracy' years. If it
>isn't available new, then buy a second hand copy, you should get a
>manual and you can still help support your Atari and it's community.

I really can't follow your reasoning, and the worst outcome of someone "pirating" (It's even silly to use that word in this case, we aren't talking about MagiC, NVDI or Draconis here, but rather about Degas, KCS or TOS 2.06) GFA BASIC would be some new Atari apps developed with that pirate copy, and I can't pish myself to actually condemning new ST s/w development.

Hiya

No! what I am trying to do is recover files from a disk that has gone
wrong. There are 2 files on the disk, one of which is quite simple as I
know the length and start of the file. The other, on the other hand, I
don't know the length OR start cluster/sector.

What I need to do is track down the header, start of the file, and try
and suss the length out from the header (hopefully). I have already
found the end.

I would presume the first few bytes of the file will give info on how
long each segment is, whether it be the 1st track, 2nd track or layout,
or an offset to the next segment.

There MUST be some documentation, or someone that knows, somewhere!

```

Hi

I started collecting data for a collection, all I have at the moment are some 6 chips sets.

I did have more, but some person (whom may be typing this) messed up B-I-G time when saving the data to file... and saved memory data instead of the ic data. (what a plonka!!!)

I was hoping one day to have a custom TOS system running, with the desktop how I like it and possibly a couple of other features.

Hi Iggy

>I recently got a load of cheap Amiga mice (HiSoft are selling them at batches
>of ten for �25), and since I've got no really good ST mouse, I was wondering
>what an adaption would entail.

Ive got a couple of mice that are switchable Atari/Amoeba, take a look inside and
see
if there's a space for a swich that could be manually linked in.

>or more ago.

So its alright to take cars that are 5 years out of production, my neighbour has a
7
year old Cosworth, i can now help myself "as its out of production".

What about custom jewellery, as since its unique is out of production as soon as
its
finished. How about vintage wine, there's a restaraunt near me with some 20 year
old
bottles, i can help my self as its 20 years out of production.. Etc Etc..
How old is your TV and video, if its older than 5 years i want it!!, and seemingly
can
have it on your principals.

Yes that's where I found it too, a long time ago, but then I didn't pay much attention to the gemx.h part of the package. Thanks for the info.

Now if only someone had the english translation of the vr_transfer_bits part of the NVDI5 documentation. It seems this is what I need but I still didn't get it to work with my project....

>Artur

No, you're the fool and for more than one reason.

Firstly, for asking for binaries to be posted in a text-only newsgroup;
Secondly, for asking for commercial software to be posted;
Thirdly, for posting in the wrong order.

If weren't so clueless, which you've shown yourself to be, you wouldn't have asked for either of the first 2, and the third wouldn't have happened as you'd notice that people post in a top down format.

And before you make the comment that your software puts the cursor at the top of the quoted material, even Microsoft advocate replying AFTER the post you're replying to as well as snipping out all the extraneous bits. More info at:

http://www.jsiinc.com/newsgroup_document.htm

scroll to the bottom of the page to see their posting guidelines.

Finally, just so you don't think I'm a nasty, nit-picking person, you can find some C programming tools at:

ftp://chapelie.rma.ac.be/atari/programming/

Regards,
  David Bolt

Many thanks for your response. The data base is the data for a program.
It consists of various alphanumberic and some 16 bit integers only. I
think the record size is about 250 bytes per record. I don't feel there
is a problem here ONCE I can read the discs!

Shall follow your suggestions on disc copy/xfer later in the week.

Once again, many thanks.

Regards,

Ernest

Hello everybody,

there is one good reason why this problem keeps coming back... Some disks can't be readed by the PC in any way... I tried everything: different emulators, different formatting programs, and the truth is: my 4meg STE can read them, but the PC can't... I keep reading this newsgroup (and others) and the answers are always the same... So I am a bit shy about showing the ugly truth... I have hundreds (no kidding) of disks with Notator files, and I want to save them in iso cd roms... I have no idea why, but about half my disks can't be read by the PC or any emulator, and the PC crashes if I keep trying... The other half of my disks can be read by the PC without problems...I have no idea why... I have way too many disks to be transfering them one by one... The other ugly truth is that I can't find dd disks for sale in Paris, France... When I try to reformat old dd disks with the PC, they not seem to be reliable... I have some hd turned dd disks hanging around too, the STE can read them so far, I know it is not an good idea, but what else can I do?

In a related topic, I can't read the zip and syquest Atari-formatted cartridges with my PC either... My ICD link is dead (my Atari number two died at the same time), the cartridges were formated using ICD software, maybe there is the reason... My syquest EZ135 died its ugly death too, I bought an EZ Flyer 230 to read the cartridges... No luck with Atari formatted cartridges, but my Akai S2000 formatted cartridges (zip/Akai disks are fine too) can be read by the Akai and the PC, using Mesa software... I can read Mac formatted syquests in the PC using Mac Open... Syquest is out of business, easy to know why, so I want to transfer everything to cd roms...
Many thanks...

I am aware that the GFA company page makes no mention of Atari
these days... but if you e-mail them they are quite serious
about their rights. Not the best arrangement I admit, but
that is how it is and one should respect their rights.

> If GFA BASIC is uploaded to some FTP or WWW site, it is very much available.

You can get GFA at most Atari dealers if you would check.
Perhaps you should take up your cause with something that
really is NOT available anywhere?

Simply not true. The demand for GFA is so low due to the Atari market
there is no profit in it. They support it best they can, I've written
GFA and when v4 flopped nobody else came forward to continue and try
to hire some to do it now? Probably a pipe dream.

Then have him look at the System For Tomarrow website and purchase
GFA like a normal person.

Try reading them in DOS. Exit Windoze altogether, then access the
disks using A:\ at the DOS promt. That always works for me, even
disks formatted at 10 sectors 84 tracks!

I'm pretty sure that is the problem. ICD software is not PC/DOS
compatible, that's why we all use HDDriver.

I have a few ZIP disc written using ICD software.
I can transfer the contents to my PC using the Gemulator xplore
program, but only at a file level. Since I have several deeply nested
folders the transfer procedure is real slow.

Hi All

Having just been given a 1040STf after being out of the scene for years, I am trying to remember the mod that has to be done to get the monitor output to work on a scart (Peritel) cable to a TV.

I vaguely remember it needing a couple of diodes from the horizontal and vertical sync to somewhere in the cable.

Sorry if this a FAQ, but I have had a look at loads of ST sites and failed to unearth it.

Anyone remember?

Regards

Mark Painter

I will have a look for it. I am running Hddriver 7.6 though. I got it mostly
working (can read the TOC), need to enable ide2 in device configuration,
then turn off allow cdrom (so it wont set aside a Scsi level drive letter).

More Later

I could suggest that you look at BoinkOut available at my web site. http://www.netset.com/~baldrick/boinkout2.html

Or talk to Mario Becroft and ask him about CGEM.

The reason for this is that we both have C routines do do what you seem to be looking for that do not rely on NVDI being installed on the USERs system.

Hi

I have several ST's, although I have sold a few of my top end STE's.

NONE have I had problems with formatting disks to be read by a pc, and I have access to 3-4 pc's.

If you are formatting 1.44 meg disks on the Atari and you DO NOT have a HIGH DENSITY drive fitted, then that's your problem. High Density (HD, 1.44 meg) disks can read BOTH 720k (double density, DD) and 1.44m (high density, HD) disks.

There are several programs that can format you 720k disk so that it can be read via a pc, but I use just 1; DC Format 3.0 available from: www.last-pd.co.uk

This has NEVER let me down and also copes with EXTENDED FORMATTING.

If you have problems with windoze, and I've run under '98, '98se and me, then exit to dos and try.

> I have way too many disks to be transfering them one by one... The other ugly truth is that I can't find dd disks for sale in Paris, France... When I try to reformat old dd disks with the PC, they not seem to be reliable... I have some hd turned dd disks hanging around too, the STE can read them so far, I know it is not an good idea, but what else can I do?

I've heard of people turning dd disk into hd disk, which shouldn't be a problem, BUT it's not a good idea to cover the hole up on a hd as it doesn't change the media that's used.

Out of all the drives I have only ONE can read and write to a hd disk. NONE of my dd internal drives will. and the data is still unsecure on the one that does. Remember all it takes is 1 bit in the disk structure to go wrong and you program/data is in jeopardy. 1 bit can lose you a sector, a track, a file and that's not thinking of a program integrity.

I have a couple of thousand dd floppy disks I'm trying to clear out, they all have pd/shareware on.

>
>In a related topic, I can't read the zip and syquest Atari-formatted cartridges with my PC either... My ICD link is dead (my Atari number two died at the same time), the cartridges were formated using ICD software, maybe there is the reason...

ICD doesn't support dos/tos compatible formats. HD Driver is the one you want I use it and transfer data between my Atari's and pc's all the time using MO Optical disks (650meg), I have also used EZ135 before I got the optical drive.

The disk aren't automatically formatted to be read from DOS, you have to specify it. The version of HD Driver I use, you can only have 1 partition and I don't know if this is still the restriction or not!

There's just one thing that has come to me, windoze has a problem with some filenames and extension. So if you come up with problems transferring 1 or 2 files but the rest of the files on the disk/drive are ok, then try renaming them on the Atari and try again.

I got around this restriction by having a small text message giving me the name of the file I gave it and the proper name it should be.

This is unlikely to be a termination issue. I might be a cable issue
if you've moved the cable about a lot, but this is still unlikely. I
would put a voltimeter on your power supply and watch closely -- if
it's not that, your mechanism is probably dying -- I'm afraid that the
Syquest drives don't live forever.

There is an Atari PD program called DISKMOD.TOS that writes an IBM-type
boot sector on an Atari-formatted disk. It's used with a file BLOCK0.DAT
which contains the boot sector data (and presumably can be modified with
a HEX editor to suit all requirements if you know what you are doing).
If you like, I can email it to you - it's quite small (7 kB, plus 512
bytes for the data file. I take it I need to take out the part of your
address in capitals?

Strange that your PC can read some disks and not others. Were they made
on the same Atari machine? And is the problem with disks made after a
certain date? Because it may be that your read/write heads were slightly
off-track.

>In a related topic, I can't read the zip and syquest Atari-formatted

>died at the same time), the cartridges were formated using ICD software,
>maybe there is the reason...

The carts were probably not formatted TOS/DOS compatible. HD driver can do that (but that won't help you now :-( ).

>My syquest EZ135 died its ugly death too, I

Oh dear - hope mine doesn't do that - I need it for backups.

Regards, /Peter/

I got it going:-). Dont know what I did exactly (replaced the config.sys with a modified one of Lyndon's) but it work's, thanks for the help.... Now 2 new question's, are there any simple cdaudio players avaliable, and can you have both the high sierra and the iso9660 BOS drivers runnig at the same time?

Cheers

Hi Steve

I have submitted your Question to the Atari-midi Egrp. There are 123 members. Maybe SOMEONE knows the answer! Might be hope yet! I will keep you informed of any responses.

Tim

I would like to invite anyone of you to the Atari-midi mailing list.

Hmm, this looks interesting and I am already browsing through it. What we get with our functions is the memory that can hold either 8-bit depth information (every pixel is 1 byte, and they are organized in one-after-another way) or we can have 24-bit pixels (R-G-B). What I initially set out to look for is something that can efficiently convert this memory to how MFDB requires it to be (I guess this would be the bit-planes). So, which function in XIMGLOAD.C should I start from to get what I need?

     If you are looking for just conversion from planar mode
```

(1,2,4,8) then transform_truecolor() is the routine that you want to look at. It has a few supporting routines that are used as well. It will take an device independent buffer at MFDB * and convert it to a device specific MFDB.

Also the 24-bit pixel format described above is what you will want to use if you are in a 24 bit depth (device specific). 8 bit, 1 byte, planes one after another is device independant and what needs to be converted to the current screen depth.

Conversion down from 24 bit is not that hard to do and could probably be modified out of the routines in that file. I have some routines that 'dither' to the screen bit depth. But I haven't gotten them worked into anything that has been released.

Yes, you can have more than one DOS (you said BOS, but easy to confuse!) installed. Under single TOS, you can't access audio CD's in the GEM window.

Programmes, like CDPLAYER by Alexander Clauss will
control the drive with AB repeat, stop, play etc and it will also rip parts of the CD off (not literaly!) in WAV, AVR AIFF. At quite a few sample freqs, 8/16 bit and mono/stereo.

Ok if anybody has c/c++ or GFA basic please send it to my email address. No German

or other language versions except english. I have some Falcon and ST programs, if
you
upload what I need I'll exchange something for you...

Artur

and his cozy Atari ST :)))

>> Certainly, you may buy it from Falke Verlag (IIRC), but please tell me why.
>> It is a discontinued piece of software.

>I am aware that the GFA company page makes no mention of Atari
>these days... but if you e-mail them they are quite serious
>about their rights. Not the best arrangement I admit, but
>that is how it is and one should respect their rights.

I think they should stop holding onto something which they themselves have
killed off.

>> If GFA BASIC is uploaded to some FTP or WWW site, it is very much
>> available.

>You can get GFA at most Atari dealers if you would check.

A web site is far more available than an atari dealer nowadays. I see them all
of the time, but have yet to see a living, breathing Atari dealer.

>Perhaps you should take up your cause with something that
>really is NOT available anywhere?

Why? I fear that your reasoning would be just the same.

>years i want it!!, and seemingly can have it on your principals.

How about digital media, which can be copied without harming the original?

You analogy just doesn't work, in particular not in the case of obsolete software.
I don't support pirate copies of actively developed C compilers, but I welcome copying of years-old BASIC compilers.

does anyone know of this game?
has anyone played it?
I would be most pleased if someone who played this game and got anywhere in it would reply.
It was one of the st's first ever games and psygnosis first game for the st.
you played a futuristic hero who had to prove his innocence ,for what I dont remember.
it was a truly original game

I thought that Kobold had to be switched to GEMDOS mode for ALL CDROM drives, simply because access to them isn't possible via the low-level routines built into the OS.

I have used ZIP on my 1024 STM, ICD II with their software. I got the
required power from my joystick port with an adaptor supplied by an
Atari dealer. The adaptor was not needed after a HD was inserted in
the SCSI chain.

I had lots of problems with cables, eventually assembled a short
ribbon cable myself and this solved the problems.
good luck

Norm

(Sorry I've taken so long to reply - I've been to-ing and fro-ing between a few different tasks [embedded firmware programming, tweaking my Atari DLL manager, celebrating a major birthday, and so forth])

AFAICR, the Y2K problem I had was more related to files being incorrectly date-stamped, and dates being wrongly displayed/sorted on the desktop (both the supplied TOS 3.05 desktop, and the MultiTOS desktops under AES 4.0 and AES 4.1, and within AES 4.1 when it was single-tasked [ie without running it from within MiNT])

I had a quick sniff around, and, without spending a week iterating over the same few hundred lines of assembly code from within the Devpac debugger ("Mon") it looked like there was some inconsistency with the current time and what the TT's clock said the current time was.

From having a quick look at the patch I wrote, it was a simple AUTO-folder TSR which intercepted the OS time functions and emulated what they were supposed to do (ie either return the current click settings, or to reprogram the onboard clock chip). That seemed to fix the problem for me.

However, as I was having a few problems with my TT and monitor around the same time, I took it with me when I went to see Brian and Mario Becroft, and they managed to fix the problems I was having hardware-wise with my TT/monitor. They also wired up a new clock battery for me.

Is there a patch available for MagiC? If so, does it work with all
versions?

Or is this a DIY job?

TIA
```

Eucalypt Software - Makers of Autopost & Rocketfuel --- Ripped Me Off!!!
-
All potential buyers should be warned to steer clear of this company. They have a repeated pattern
of ripping people off and ignoring requests for support.
-
I know someone who sent in the $10 registration fee for Autopost TWICE (thinking the first one may
have gotten lost) and in both instances, never got a registered version of the program and all of his
emails were completely ignored.
-
I myself purchased Rocketfuel on-line and had to pull teeth to get an unlock code. The web site was very
quick to take my money, but no registration/unlock code came for days and days. I repeatedly emailed them,
only to receive nothing but autoresponses. After 5 days I sent them a message stating that if I did not have
a working version of the program by the close of business that day, that I would challenge the credit card
charge. Magically, the code arrived several hours later.
-
What kind of way to do business is that?
-
In any case, its academic... there are other products available for free that do

virtually the same thing
and I only wish that I had known about them before I wasted my time with Eucalypt Software.
-
If your in need of automatic news posting software, there is nothing better than "NNTP Power Post 2000".
It's graciously been made available free from the following web site:
-
http://net-toys.8k.com/
-
Save your money... your time... and the aggravation!
-
Peace,
-
PPN
-
-
PS: I have no affiliation with the makers of PowerPost 2000.

What happens to symbolic links in MagiCMAc ? I've seen all works as on normal MagiC when the partition is Atari-formatted, but I have problems when the partition is HFS, links seems not to work, and copying files and links gives unexpected results, can anybody help please ??

It was a DIY job in my case, although I did place a patch program, and the assembler source code, on my (really boring) website. It only works with v5.11 and has a few checks in place to make sure it doesn't do anything wrong and, with a small modification, should work with any version.

I was going to update it to handle v6.x when I upgraded, but I have yet to do so.

If you want a look at it, the direct link to it is

http://www.my-ste.demon.co.uk/files/patch.zip

Regards,

David Bolt

Greetings all,

I seem to be experiencing problems with ConNect '97 after installing hsmodem on my Falcon. On startup, ConNect complains with "Your port settings are not available." -- and as a result I can't access the modem.

Without hsmodem ConNect seems happy, but then there is the issue of having an unstable connection at 56k.

Any suggestions on this weirdness?! The problem occurs with MagiC 4 and TOS 4.04 (clean auto folder), starting hsmodem package from either the auto folder or desktop.

Thanks,
Karlos.

Check that drvin.prg and scc.prg are in that order in your Auto folder, and
near or at the end (but before any internet stack software you might have).

Connect 97 is a beta so you might be better dropping back to 95, although I
don't think that that is the cause of your problem.

After upgrading to Sys 8.*, I have the same problems with MagiC Mac as
well as Mac "alias" icons. Went back to the original file, launched it,
and it seemed to work ok. Some of the apps had lost their preferences
however. New fangled stuff..... I've noticed problems with MagiC Mac,
Netscape, Graphics Converter, Fetch....

Hi all-

I have an Atari STe and possibly an SM124 monochrome monitor I'd be willing to trade for an SC1224 color monitor or software lot (among other things!)

The STe is missing all the screws and doesn't have the original internal floppy drive (the original drive is gone and someone attempted to put a PC drive in its place, I believe). The system works, however, but it could also be used for parts. :) The monitor also works, but has a few stickers on it.

If anyone is interested, please respond to jgrand@mindspring.com and I can give you more details. I have one 1040ST that I am trying to build up into a useful system (which requires software, etc.) so if you have anything good to trade, let me know!

Thanks!

Joe

You dont say what parts of HS-Modem you have installed?. Make sure that DRVIN.PRG
runs before its companion, and that both prg's are at the end of the AUTO folder.

HDDRIVER is commercial software, i. e. you have to pay for it. Please refer to http:/home.nikocity.de/nogfradelt/hddriver_english.html for more information.

Note that I will stop the development of software for the Atari when I find that more and more users are using illegal copies. There are only a few Atari users left anyway, so you ask yourself whether writing software for the Atari instead of another platform is not a waste of time. Writing software only in order for this software to be illegally copied definitely is a waste of time. So if you're interested in being able to get up-to-date software for your machine any longer, don't ask for or use illegal copies.

In uno strano messaggio del 23 Aug 00 magicmac@my-deja.com (2:333/608.1)
scrisse al povero All :
 m> After upgrading to Sys 8.*, I have the same problems with MagiC Mac as
 m> well as Mac "alias" icons. Went back to the original file, launched it,
 m> and it seemed to work ok. Some of the apps had lost their preferences
 m> however. New fangled stuff..... I've noticed problems with MagiC Mac,
 m> Netscape, Graphics Converter, Fetch....

So would you suggest to stay with Sys 7.5.5, or is it just a matter of
reconfiguring some apps and then it will go right ?

What may be Sys 8 better for, expecially on my old Quadra 800 always running
MagiCMac ?

I have to agree, we ought to really support software authors that continue to support the Atari/TOS scene, without them we would be having a hard time.

Equivalent software on PC's would cost a damn sight more than what you pay on this format.

If you've got copied, pirated, software and USE it regularly BUY the legit copy. Without financial incentives GOOD quality software, not the ones that are thrown together using crude BASIC compiled programming, this type of software and support WILL disappear.

50% of all software I use are from naughty copies, but I then buy the full item. It's amazing what software I come across on 'blank disks' and I find I can't do without, and what's more you usually get a manual which you can thumb through, and some with diagrams!, rather that inaccurate test files etc...

For all of those kind people accusijg me of asking for pirated or illegal software....and saying that I should support programmers and the like....let me say..I did not ask for any illegal or pirate software..I just ask for a chance to try software to see if it will do as it claims or not. I do use legal software...(I even have a full dongled copy of both Cubase and a seperate dongle for my Cubase Score.)....I have been happily using the correct software as supplied by the manufacturers with my ICD Link2...but they say in the manual that it will recognise Syquest cartridges formatted on a PC.....this is blatantly NOT true....it will not.
HDdriver claims the same facility..most of the companies in UK who sell Atari software and repair Atari seem to say to me that HDdriver is also not capable of thie function that I require. I have tried the demo version of HDdriver this certainly does NOT support PC formatted cartridges.
All that I asked was....does anyone have a full version that I could try to see if their claim that it will allow Atari to read both Atari and PC formats is valid.
If all software was as bug free and as efficient and good as the programmers and companies claim, I am sure that there would be many more people buying and using the full commercial products.

Of course it doesn't, unless you use MiNT or MagiC too. But HD-Driver lets

you *partition* the disks so they can be used both on a PC and with TOS
(and ofcourse MiNT and MagiC). It works, I use it myself all the time.

OK...so now we get some of the truth...I do not use Mint or Magic or
anything else...I just use a basic STe with 4Mb. I only use it for
Cubase...nothing else..I do use a Syquest Ezflyer (SCSI) rather than a
static hard disk for data storage.
I wish to find a simple way to be able to take the Syquest and connect
to my PC .... and then for the PC to be able to read the
cartridge which I have been using to store my hundreds of Cubase files
on and I can then save them to a hard disk on my PC as extra safety
back-up.
Now......question...do I need another system such as ..Mint, Magic or

whatever these are to be able to use the HDdriver sofware.???.. or can
I just use the HDdriver software instead of my ICD software and be
able to do the things that I require.?

It definitely does but MagiC or MiNT is required for this. These
requirements are also mentioned in the demo version's README and/or my
web pages. Regarding the use of PC compatible media without additional
software like MiNT or MagiC: This is only possible with the full
version.

> All that I asked was....does anyone have a full version that I could

Why don't you ask in this group whether the features claimed for
HDDRIVER actually work? Or don't you trust in the Atari community
telling you the truth?

> If all software was as bug free and as efficient and good as the

> programmers and companies claim, I am sure that there would be many

That's not correct at all but I don't want to go into detail here. Experience shows that you can't argue with people using illegal software. Either what you say is correct, i. e. you're willing to buy a piece of software if it works, then it will be sufficient for you to ask other users about their experiences with this software before buying it. Or you are not interested in paying for the software you use at all. In this case any discussion is useless and you may be proud of being one of those responsible for an even faster decline of the Atari market :-(.

There are two ways you can handle your problem with HDDRIVER:

1. Using DOS compatible media, i. e. media either created with a PC or

created with HDDRIVER on the Atari. (HDDRIVER and its tools support the creation of DOS/Windows compatible media on the Atari. That's easier than using the PC for creating these media :-) But: For DOS compatible media MagiC or MiNT is required since TOS won't handle these media, regardless of the hard disk driver being used.
2. Using media that are *at the same time* DOS/Windows and TOS compatible. With HDDRIVER you can partition your hard disk drive or cartridge with a single partition that is *at the same time* DOS and TOS compatible. No additional software (i. e. no MagiC or MiNT) is required to use these partitions and you also don't need any additional software for the PC. So all you need is HDDRIVER, create a TOS/DOS/Windows compatible partition and then you can start immediately with using this partition with TOS or DOS/Windows.

Hi

HD Driver does the job and does it well:) I use it to transfer files from my ST's and Falcon to the pc via a SCSI card.

I have used it with SyQuest EZ135 carts, hard drives, MO Optical disks (640meg, although you only can use 512meg).

All this under standard TOS!

```

Don't forget Big-DOS here - using it allows you to access such partitions under plain TOS as well.

Ciao

Thomas

I'd like to add that this limitation is not imposed by HDDRIVER or the drives but by the version of TOS you're using. For TOS 2.0x/3.0x the maximum partition size is 512 MByte, for TOS 4.0x it's 1 GByte. So if you were running TOS 4.0x would be able to create a partition on your MO drive's cartridge that would have a size of the full capacity of the cartridge.

I ususally don't mention Big-DOS anymore since there are quite a lot of
users where it doesn't work reliably. Especially on the Falcon Big-DOS
has bugs.

Can we agree that the Falcon itself is a really buggy machine?

Not being a programmer, I'm a little unclear about what you mean, but it
sounds similar to the problem outlined by Clive Williams
(http://www.bygjohn.co.uk/atari/y2ktxt.html). Could you confirm that
we're in similar territory here? If so then it looks like there are
problems with all TOSes up to 3. 4 seems to be OK.

Glad you managed to get that fixed.

I just got a (legal with key) copy of CAF 2.06 for my Falcon. Cubase just
bombs on me everytime. It will run for a little while, then bombs away.
Does anyone have any suggestions??? I have 14 megs of ram, scsi drive for
audio and the Falcon Digital Interface.

Thanks,

Dylan

I'm sure all those people who had their 68030 removed by Rodolphe
will be happy to hear about this. As Kellis, for instance.

I have to agree on this point, one of my supposedly identical Falcon motherboards is sooo different in it's behaviour you wouldn't believe they were the same machine.....

HD-Driver is one of the best bits of Atari software ever created, I can't believe I went so long without it....my machines are prolly going to grow an LS-120 drive each soon, I trust HD-Driver to get them working...

At least as far as SCSI/DMA is concerned, yes. But this has nothing to do with the Big-DOS issue. Big-DOS simply doesn't work very well with TOS 4.0x. But this actually doesn't matter too much since MiNT and MagiC are superior to Big-DOS anyway.

The feedback I saw from users with a CT2 results in the opposite
impression.

Recent statements here about the Falcon being
'buggy' have gotten me wondering which machine
would be better for Linux (Debian) m68k. The
Falcon is an early 4.01 TOS with a max of 14mb.
The TT has only the ST ram plus 8mb? Both

machines DO have FPU chips. Can I get any
serious RAM for these machines today? Video is
not that important as I just want to use Lynx. An
old slow scsi cdrom drive is available.

Greetings,

Ok, thanks guys. The problem was that I after launching drvin.prg, both
scc.prg and mfd_falc.prg (forgotten its spelling) run afterwards, and as
pointed out, only drvin.prg & scc.prg are needed.

So downloading files at 56k is nice 'n' stable now.

Thanks,

Karlos.

Actually both machines are too slow to really have fun with Linux. Put
some more RAM in the TT, e. g. 64 MB Fast RAM, and you can at least do
some work with Linux.

Intel or Alpha -based machines are best.

> Video is not that important as I just want to use Lynx.

Then use MiNT with its port of Lynx, on Atari.

I would use the TT. It is a little bit faster than the Falcon. As long as
you work only with the console, Linux is no problem, even with only 12 MB
RAM in total (Linux does not differentiate between the two RAM types). But
you should forget about working with X11 or compiling large stuff. You did
not write, what kind of RAM-chips your TT-RAM-board needs. I did not have
any problems getting 4 MB 30 pin SIMMs for my TT.

Regards,

Kerstin

Sorry about that - I sometimes forget where I am and start sprouting
confusing jargon when I shouldn't...

I've had a quick look at that web page, and what it discussed seemed
very similar to what I experienced with my TT.

I cannot recall how the XBIOS programmed the hardware clock, (it's almost eight months since I tinkered with that code, and I cannot recall the details) so I'm unable to verify whether the bug described on the web page is the same

The patch I wrote was a simple program (written in assembly language using the Devpac 3.1 assembler) that runs from the AUTO folder when the ST starts. What it does is redirect the XBIOS calls into itself, so that when an XBIOS function is called, it will have to go through my patch first.

Once my patch detects that the XBIOS Gettime/Settime functions are called, it passes control to my replacement functions instead of the XBIOS functions built into TOS.

If the function being called is Gettime(), then it reads the time from the hardware clock within the computer, and formats it appropriately, and returns the result to the program that called it.

If the function being called is Settime(), then it takes the "current time" value that was passed to it, formats it into a form that the computer hardware can understand, and then programs the hardware clock appropriately.

Needless to say, if the function being called is neither Gettime() nor Settime(), it will pass control to whatever application held the XBIOS vector before the patch was loaded.

I've heard the annual sale and swap meeting of the Columbus, Ohio, Atari club will be taking place on Saturday, September 9th. Here are some details I've heard about this event:

Time: 9 am to 3 pm (Eastern Daylight Time)

Place: Oakland Park Community Center, 980 Lenore Street.

Location: Use East North Broadway or Cooke Road exits of I-71, northeast side of Columbus.

Admission: $4 per person. (Maximum $8 per family.)

Basic Falcon and CT2 Falcon are stable.
"Stable" is a know how question..

"QuickShots" and " i�m not shure it�s correct" won�t run.

Regards, Robert

OK, youve got me there 8~) how about asking the users with working CT's, the non-working one's are a different issue, also partly related to the falcon being shitte.

Hi,
�
Many years ago, I acquired a "PC-Speed" hardware device from SACK Electronic GmbH, which would plug over the 68000 CPU of an ATARI STe, and give access to DOS� based programs.
�
In fact, I never went on to installing the device, (probably because I didn't want to void the ATARI's warranty), and the box laid in the back of a drawer for many years. Finally, I have decided to give it a go. I have all that is necessary (the board, the software) except the installation leaflet which presumably explains the hardware installation procedure (in particular,� which way round you should install the board). My board is specifically for STe's (square type CPU).
�
So, if anyone has experience with this, and has kept the installation leaflet, I would be very grateful if you could send a copy (either scanned leaflet, or just the instructions).
�
Thanks in advance,
�
Patrick

ExtenDOS Gold Ver 3.2b & HD Driver 7

I have the above programmes for sale. I brought them at last years Atari show in Staffs. Due to problems that I was never able to solve, I have never installed them so are new in packets complete with serial numbers.

This cost me over �70.00 new so if you are interested, make me a sensible offer.

Many thanks...

James

> I would use the TT. It is a little bit faster than the Falcon. As long as you work only with the console, Linux is no problem, even with only 12 MB RAM in total (Linux does not differentiate between the two RAM types). But you should forget about working with X11 or compiling large stuff. You did not write, what kind of RAM-chips your TT-RAM-board needs. I did not have any problems getting 4 MB 30 pin SIMMs for my TT.

I don't know. I have my TT set up to run X at 1024x768 and run a couple of xterms, lynx and a few other small things. RAM makes a difference though - you'll want 12/14MB or more if you want to run X - I'm using 10M with tvtwm, 2 xterms, xclipboard, xconsole and xclock. Performance isn't too bad really. Mind you compiling a new kernel and userland takes almost a week! One thing to bear in mind is if you want to run X, it would be nice to have a graphics card in the TT and I've no idea where you can get one these days.

J

PS. NetBSD/Atari, 20MB TT RAM, Crazy Dots II, Cabletron SCSI-ether.

I HAVE A C-LAB FALCON WITH 14MB
I run in order the following programs from the auto folder
1.BOXKITE
2.JPEGD
3.DRVIN
4.SCC
5.RSVX
6.TOS2GEM
7.ROMSPEED
8.WINXCOOK
9.WINX

10.MINT (VERSION 1.15.5)

For ACC I have Minsetter 4.0
and I'm using the SERIAL PORT CPX that comes with Sting

I connect using PPPD 2.3.11
I am using gem.sys because I haven't any luck with Oaesis or Xaaes(I did have a little more luck with Oaesis).

Well my problem is when using CAB with ovl 14008 I get the following alert box and the program will exit

pid 91 (CAB):BUS ERROR:
User PC=12,Address:21780C
(basepage=6C27A0,
text=6C28A0, data=71C3E2,
bss=71C3E2

I'm not certain if the value are always the same.

What is causing this BUS ERROR and how can I prevent it from happening?
Thank You

Emphasis is here on small things. It is OK to run lynx or xterm, but if you want to run larger graphical stuff, e.g. a monster like xfig or this sequence editor I compiled, you need some patience. Xjewel e.g. runs quite well.

> RAM makes a difference though -

It is worth while trying. Installing Linux on ones Atari is really quite fascinating. But it is really important to have enough RAM. With 12 MB total RAM and X11, it will constantly swap when running larger graphical soft.

Hmm, first Debian versions were optimised to work with TT high. If you can get hold of a TTM 194/195 or compatible, you are on the save side, although it would be definitely more esthetic to have colour on ones screen.

Regards,

Kerstin

I can't help you but I found that on my TT030 Cab 2.80 give me lots of BUS ERRORS. That's why I'm back on Cab 2.70 which seems to be more stable. OTOH on my Hades Cab 2.80 works (almost) perfect.

Do you use Gluestik? As you use PPPD as TCP/IP stack and the STing Cab-ovl you must use Gluestik. Gluestik forms the bridge between MiNT-net and the STing clients.

Just a thought. Can these BUS ERROR be caused by lack of memory?
On the TT030 I only have 4+16 MB. The Hades has 128 MB. The setup on both machines takes almost 10 MB.

Hi Martin

Don't think it can be lack of memory, got 48 MB in my Milan, and I've
also experienced that 2.80 gives me some BUS ERROR's. Can it be that
2.80 handles memory management differently? On the Hades all is
considered ST ram right? On my Milan I have 14 MB ST ram and the rest
```

is TT ram.

I just reminds me something. On the Hades I use a patched version of
Cab 2.80. On the TT with only 4+16 MB RAM I use the original version.
I've patched Cab with this program:

ftp://chapelie.rma.ac.be/atari/utilities/patches/paspatch.lzh (3.989 bytes)
(There is a bug in the memory-management SYSTEM.PPU of Pure Pascal,
(that leads to crashes with few memory. PASPATCH.TTP patches this bug
(if neccesary. Such programms are CAB or Texel)

>Can it be that 2.80 handles memory management differently?

Don't know.

>On the Hades all is considered ST ram right? On my Milan I have 14 MB
>ST ram and the rest is TT ram.

Not quite right. If one use Odd Scanke's set MMU tool one can split
the available RAM into ST and TT-RAM. I for instance use 16 MB ST RAM
(14 available) and 112 MB TT-RAM.
This way the Hades is more compatible. Since I use set_mmu I can use
for instance the old but very fast text editor Tempus. Without that
tool Tempus wont start cause too much memory.

Ok, but origanally it's all TT-ram right? If think it's beacuse of
compability issues that the Milan Tos splits the ram.

HI Guys

Ref CAB Buss errors,

Ive recently spotted a patch that claims to repair /all/ progs written in Pure Pascal, where the libraries suffer a memory maneagment problem, mail me if interested?.

Hi Steve

I've already tried the patch, doesn't help :(
But I'm gonna play around with 'Load alt' and 'Malloc' and that stuff
a bit and see what gives.

Although I don't think it's the cause for your problems, you shouldn't use
this program.

> 7.ROMSPEED

This will only waste memory, as only a very small part of TOS (basically
just a few (X)BIOS-functions) are used under MiNT.

> 8.WINXCOOK
> 9.WINX

Ditto. This only applies to the built-in AES, which is never used at all
since you're using MultiTOS (gem.sys).

> Well my problem is when using CAB with ovl 14008 I get the following

Why use a CAB.OVL for STiK?

> alert box and the program will exit

> What is causing this BUS ERROR and how can I prevent it from

Almost certainly cab.ovl and/or your version of GlueSTiK. Try installing
the latest version of GlueStiK or use a cab.ovl for MiNT-Net.

No problem - I got myself into this when I started trying to keep tabs
on Atari y2k issues. Should have known at the start that there'd be a
learning curve WRT parts of the OS I'd never even thought about before!

> I've had a quick look at that web page, and what it discussed seemed

[...]

Thanks for the clarification. It looks like TOS 3 is affected by the problem for sure, then. I'll update the page when I get a moment.

Cheers,
John

Yes no problem:)

You will need a SCSI host adapter to connect the drive to your machine; ICD's Link, Link II, Link 97, Top Link... there are several on the market.

There is one type of hard drive that has a host adaptor built in with SCSI connectors that will allow daisy chaining! but these are liable to be expensive.

Once you have your adaptor, you will need a CD-ROM driver such as ExtenDOS, Spin... and that's about it.

Most users get a hard drive first and then add a CD drive later. Once you have the SCSI adaptor you can connect other SCSI drives like ZIp, EZ, Optical & PD drives to your system!

Oh yes! I nearly forgot... Make sure that the last drive in the SCSI chain is terminated. This will depend on which model CD drive you'll be using:)

```

>can anyone tell me the best way of connecting a cd rom to the mega st?

An ACSI->SCSI converter (a LinkII or Link97 are the best choices)
A SCSI CDROM
Suitable CDROM driver sofware such as Extendos, Spin! or MetaDOS.

Hi

What you are after is the disk version of TOS 2.06, I did have the it
somewhere.

It's virtually the same as the ROM version except you can do things like
edit icons and other bits.

I too have been getting a similar (if not identical) Bus error with CAB 2.7, Dan's 1.4004 ovl and Sting.

It started happening when I upgraded the overlay to 1.4008 and so I switched back to the earlier version but it has not gone away. Maybe it wasn't the overlay that caused it but it does seem suspicious.

I'm using a Milan with Mint and Naes.

Regards,
Peter

PS. I think many of us owe a big thank you to Dan for the work
he has put into the overlay for CAB. Three cheers...

Yes it is possible. You need the disk version of TOS or in other words an
IMAGE file. You can find ROM inages of the various TOS's on the net. The
best place to look is on the various Atari emulator sites like Pacifist.
Most of them have the ROM images on their sites or else a link.

You also need a tos loader program of some kind if you are soft loading a different version of TOS. T206exl.prg and T206el.prg are both such loaders. You put the loader program in your auto folder and the TOS image in the root directory of your HD, you may have to rename your tos image to what the program wants.
These only load the British versions of TOS 206 however, does anyone know if there is a version that loads the American TOS 206?

I have found that I can - although not without some problems.

I can only use drive ID set to 5. If set to 6 my ST's error on boot.
I have checked ID's of any/all other devices and there seems to be no
conflict (this includes opening up to check for internal terminators
and jumper settings).
>
> I had lots of problems with cables, eventually assembled a short

This is exactly what I found here too, had to obtain a very short
quality cable and this helped no end. Even with the same configuration
I obtained errors but the short cable has cured this - touch wood!

Cheers
Sean

That's funny! I had something similar with a drive:)

I had to have my main hard drive as device 1 and an MO drive as device 5
on an STE with a Link II to work in the chain... To this day I still
don't know why!!!

Thanks Steve, I tried abosolutely _everything_ I knew to get this zip drive working on ID 6 and in the end gave up and settled for just having it working! :-)

I have a Zip Plus which is the SCSI/Parallel port version and thought that it was an incompatibility problem with the "Auto Detect" cable causing all the problems, so decided to connect my Zip Plus to my Sampler (worked great) and save up for the SCSI version. Guess what - same problem! This is with a Link 97, STe or STfm usinh HDDriver 7.8.

Having said that I think I was lucky because (unknown to me) iOmega ageed to take back Zip Plus drives due to a number of problems but - touch wood - mine is working fine with both Atari/Samplers and even a PC at work that I use.

Like I said though, now it _is_ working with the current configuration so I'm happy with that - although it's annoying that I don't know _why_ it plays up if set up differently! ;-)

I'm looking for these formats. I found some emulator source code and disk utils too, but I can't find what I need. I searched the web for like three days and found nothing. It it's in the FAQ then consider this a request as I haven't seen it here.

I found the MS-DOS FAT format which is similar, but useless. I have part of the boot sector info, but not all. I need a byte-for-byte description of at least the FAT entries, and the boot sector and geometries would be a bonus. thanks in advance.

Wow!! not exactly asking a lot!!! The boot sector is quite straight forward if you want a byte-by-byte description, WITHOUT the boor rules and numbers etc..

Now the FAT tables are something completely different and wouldn't I couldn't go through the motions and details here.

One of the best, but not the only source, of info for the FATS (including programming of the FDC) is Atari ST disk drives inside and out published by Abacus (13): ISBN 0-916439-84-4.

Byte	Name	Description
$00	BRA	Boot command to boot a program if present.
$02	filler	reserved bytes or loader
$08	serial	serial number
$0b*	BPS	Bytes per sector
$0d*	SPC	Sector per cluster
$0e*	RES	REserved sectors
$10*	NFATS	Number of FAT's
$11*	NDIRS	Number of possible director entries
$13*	NSECTS	Number of sectors ON the disk
$15*	MEDIA	Medium description
$16*	SPF	Sectors per FAT
$18*	SPT	Sectors per track
$1a*	NSIDES	number of sides
$1c*	NHID	number of hidden sectors

*= Correspond to the BPB of the disk. These entries are identical to those of MS-DOS.

$1e	EXECFLAG	flag for command.prg
$20	LDMODE	flag for file or sector boot
$22	SSECT	first sector to be loaded
$24	LDADDR	Load address
$2a	FATBUF	FAT address
$2e	FNAME	Filename (usually TOS.IMG)
$39	RES	Reserved
$3a	BOOTIT	Boot program
$1fd		

$1fe comparison word for checksum.

Also the ENTIRE boot sector can be used as a boot program, and many
games use this approach.

Hello,

my monitor Atari SC1224 is dead :(
It's broken the flyback transformer, this has the sigle KF4825G
but I think who this isn't original.
There is someone that knows the present model original in the monitor ?

I've used it to switch between CAF, ZeroX and SoundPool stuff, all with
no problem.

>Under "SoftLink" I'm under the impression that switching between
>software (which is Softlink compatible) is automatic. Is this correct?
>Does this mean I don't need the switcher program or accessory?

I've never tried it under softlink I always run the program and select
the correct port and close the program. Steinbergs Midex would auto
select the correct port the Steinberg software of course.

>
>3) Uopn opening up the unit I found a switch near the "cartridge 3"

hmmm... any idea what to look for in the case of the boot-sector boot
program?  I assume that anything other than an initial 'jump' code would
do it, and I will go right on assuming that until someone tells me
different *g*
```

you have helped me a great load. Now I just need to find out how to read the files from the disk / disk image. Are they stored contiguously? Is there a link to the next sector like on Commodore 1541 disks? these are the great mysteries of life.... I assume I would find the answers in com.sys.pc.diskimage.formatspecs but my server doesn't have that group wink*

thanks,
tW

Unlike the Atari 8-bit format, which is uncanny like the Amiga format, the FAT tables contain the NEXT sector of data, along with other details for bad sectors etc...

There is usually 2 copies of the FAT tables, BUT errors can occur if the drive hasn't registered a refresh upon a change of disk! If the disk is then written to, the computer uses the data it has in it's buffer as to the disk structure and CAN slap another set of FAT tables and directory alongside the proper one (if the disk has a different format) or overwrite it (if the disk has identical format).

So if you are getting 2 different directories then this could be the reason.

The directory/sub directories contains the start sector, length, attributes as well as the name.

You can't guarantee that a follows b follows c if the drive is fragmented as the first FREE cluster is used first.

A boot sector program is quite easy to really to detect. 99% of the time the first word (byte $00, $01) will point to the start of the code, this is usually $60xx which is a 'BRA.S' instruction.

Sometimes it can have a 'JMP' or a 'BRA' instruction instead.

Boot sector programs usually load game software, I have only come across around 2 serious applications that use a sector format for the disk data. This CAN make it hard for the average user to copy disks.

Apart from games, the other application for boot sector programs are anti-virus, and boot sectors to give a message etc. and of course the dreaded virus!!!!

Floppy disks and the format is a GIGANTIC area and has taken me a lot of research, time and experimentation, OK trial and error then:), to understand it. One day I'd like to have time to be able to work out how to recover hard drives at the lowest of low level!!!!

```

I've waffled through the pinout's I have with no avail:(But I've noit
given up yet:)

Just as a matter of interest IIRC the SF354 is the single sided version,
and the 351 is the double sided one?

There is some info about the boot sector (but few details about the
FAT) in Mark Baines' 'The Atari A to Z', which is available for
download as well. Useful info about FATs was provided in the DOC file
distributed with Antic's 'Disk Doctor' which was PD, I think. (It's a
useful sector editor showing a whole sector at a time). Both should be
found at PD sites, though I don't have details. There was also a

useful set of articles in the ST Club Newsletter, Issues 18-22; I
believe they may be available on disk or perhaps download from the
FaST Club at www.cix.co.uk/~stclub/

goody! more info to use! I wish I could explain what I'm doing in ten
words or less, but it does involve implementing the Atari and DOS
filesystems for disk images. Thanks to steve and xlator.

I think the best editor, GEM based, on the market is HiSoft's Knife ST.
You must know a little about what you are doing and it's not that
flexible.

TBH I don't know....If the Link 97 host adapter i'm using has a "clock"
(I take it you mean a date/time type) I've never seen any evidence of
it working. But as you say it has ocurred to me that it could be the
host adapter, although in all the literature I've seen (not much!) it
normally states that the "System" takes ID7 - which I took to mean the
host adapter.

Regards
Sean

I have reported this problem to Dan a while back as it happens here
with Cab 2.7/2.8 using STinG and his OVL's. Interestingly, Olivier
Booklage's OVL doesn't crash here at all but doesn't have the extended
support for cookies that Dan's does. Maybe it would be worth trying
Olivier's OVL _just_ to pin down what's causing the bus error?

Cheers
Sean

Hi

I've just uploaded a page to my web site so now you can now download DC
Format 3.0: an Atari formatting program which support several; format
types (MS-DOS, spectre.. etc). This is program answers the most common
of questions: 'How can I use floppy disks between ST and PC?'

More useful programs will be added in time:) or if I get enough
suggestions for useful programs.

I've been using a Link2 and 200Mb SCSI Syquest Drive with my Mega4 ST since learning about that combination from this group and related resources. All has been well for over ayear with this setup. Now I'm starting to get disturbing problems and I'm hoping someone can help me figure out where the fault lies. Typically, the drive will spin up OK and allow me to use it for a while but will unexpectedly stop and (eventually) re-start, re-spin. This is annoying but really bad is when it just sticks, both lights coming on and not allowing any disk access...

I get this in the upper right corner of my screen: <MSENSE: $FE (5,0)>

So, what are the probable causes? I've tried a couple of cartridges and they both do it. Is it the drive itself? Anything about termination or SCSI ID? Cable? Hopefully not the Link, 'cause we all know how difficult dealing with ICD can be, no?

TIA,
rick brown

I've had exactly the same problem with my SCSI 105Mb Syquest! But touch
wood all has been going well for the last 2 months.

I used to have HDDRIVER v3 installed over the top of AHDI, but recently
wiped my disk clean and installed HDDRIVER v7. Can't remember if this
is what solved it, but does that ring any alarm bells with you?

Ive got a copy of Latice C 5.6 which Ive just installed. But
Ive noticed most of the documentation is for Latice C 5. I
also couldnt find any 'readme' or similar on the floppies which
gives you the differences. Does anyone know if the manuals
were updated?

Please stop cross-posting this thread to every atari newsgroup.

Since you are talking about some souped up ST clone, post only to the comp.sys.atari.st newsgroup, in the future.

Otherwise, if you still wanna pursue the "with the Atari logo on it" crusade, use comp.sys.atari.advocacy, instead.

If you are gonna insist upon caling it american-made, instead of having a global perspective, please use alt.buy.american.

In any case, stop poluting the newsgroup with your nonsense.

If you really want to revive the platform, start by visiting every page referenced on:

Hallvard's Launchpad http://atari.nvg.org/launchpad/index.html
The Atari Webring http://www.webring.org/cgi-bin/webring?ring=atari;list

In other words, do your homeworks first and research the current market, if you wanna be taken seriously.

There is nothing wrong with your ST i.e.: your TOS chips are not faulty.

TOS Error Message #35 was probably one of the more common error messages (there
were 40 - 50 of them. I don't think I've ever seen another Error
Message number in 12 years of ST use.

If I remember correctly it means "file not found" and I usually put it down to
the .PRG file I've just tried to load being faulty as most software
will have its own error message if it cannot find a file it is looking for.

Hope this helps.

Are you doing marketing research for you or the Milan folks?

With that said. I would still buy an Atari due to my large investment in
Atari software. Moving to another platform for me would mean paying about 3
times more in software than the cost of a PowerPC.

However:

Have you ever taken a look at the Atari clones.
They are not best on PC boards but custom design systems.

Hades by Medusa Computer Systems: http://www.kingx.com/kingx/medusa/
Milan by Milan Computer GmbH: http://www.milan-computer.de/

If you could out do these computers with great driver for Voodoo, Matrox, Diamond Viper and ATI Pro Rage in PCI, ISA, AGPx graphic cards. Support USB, Firewire, and SCSI-3. Support SoundBlaster, Creative 3D, Diamond in PCI sond cards.

Do all this and be backward supportive of all of the ST, STE, TT and Falcon software.

You would have an Atari ready for the new real world.

Best of all YOU will have do what Atari never did.

The best I would like is support for current graphic and sound cards on the existing Atari clones.

Raymond

sigh Why the blazes don't we have US-based importers for this clone
stuff? Obviously, there is an "iron curtain" of sorts between the US and
other countries when it comes to importing Atari-related things apparently.
Either that or people in the US just don't care about Atari anything
anymore. Sad.

What is more sad is your constant babling, as I and others stated
quite promptly to your first post the situation with the clones
or are you that slow? Geesh. I can predict no one will send you
money or allow you to organize such efforts after seeing this thread.
You don't even have a clear handle on the situation and some of the
people trying to tell you how it is (which you seem to ignore) are
or have been Atari dealers and coders for many years.

Your complete lack of real info, tells me you have not had an Atari
long, or you just managed to crawl out from under the largest rock
ever.

With that said, perhaps it's time to fire up that old ST of yours,
boot up a classic game and be glad you have that...

There isn't just one y2k problem as it can affect software in various
ways. I've been collating info from newsgroups and mail reports over the
past couple of years on my y2k page at
http://www.bygjohn.co.uk/atari/y2k.html

There is a hardware/firmware problem with some TOS versions, certainly
affecting 1.x and 2.x to do with internal clocks (XBIOS) - more info on
the page, and a patch to fix it for download.

There are also problems with some add-on real time clocks such as
cartridge clocks and those built in to some hard drive adaptors - there
is more info and a possible solution available for download from the
page.

Could you let me know more on the TOS 3 problem you had? It's not clear
if the XBIOS problem affects TOS 3.x or 4.x, though there were some
reports of problems with TOS 3 in c.s.a.s which sounded like the same
thing.

TOS Error Message #33 would be "file not found". #35 is often a sysmtom
of a corupted program and the best advice would be to try and fine
another copy of the program and try that.

Hiya Jared,
I'd definately be interested in getting a new Atari ST system if it could still run older Atari St software. I'm an Atari Diehard who goes back to the 2600 I got in1982 (which I still have). I've even turned my parents into Atari users too. Is this the Milan systems your talking about?

Jared Falvo wrote:

> If you knew Atari Computers was alive again, and that a 68060 or PowerPC system was available for $1,500 or less, would you buy it? If not at that price, what price/features would interest you to buy it? Would an affiliation with Hasbro cause you to doubt the quality or not? And would that doubt cause you not to buy for any reason whatsoever?

English docs for HSModem and Connect are on my website, if that's of use?

I'd pay $1500 for a new Atari or Atari-compatible system. Features I'd want:

TOS; MIDI ports; backwards compatible with STs,TTs, Falcon, etc.; good driver support for newer hardware; compatible with newer peripherals.

> Would an affiliation with Hasbro cause you to doubt the quality or not?
> And would that doubt cause you not to buy for any reason whatsoever?

Affiliation with Hasbro would not affect my purchase. Sure, they decided to back out of the hardware market but that may have been a good thing at the time (the market is swamped with too many computers and game machines). Perhaps when the time is right, Atari computers and game consoles will make a comeback.

Hi!

Robert Schaffner <doitarchive@atari-computer.de> wrote:
> bootkonf.prg 1.32 from Uwe Seimet.
> Take it from his homepage.

Well, as he refers to VGA as "flimmering", using Bootconf won't help at all (with a VGA monitor, you will always have 60 Hz refresh rate in the modes the Falcon TOS provides). He rather needs a screen resolution enhancer, like Videlity, BlowUP, and the like. They all also allow increasing the refresh rate up to a certain point. The easiest way to get rid of the flimmering in the VGA modes is using the 32 MHz clock for the video chip instead of the default 25 MHz. Of course, you need a multiscan monitor for that to work, but you'll look at a screen being refreshed at about 76 times a second, then.

Ciao

Thomas

i tried click, and drag, and it says this is only a disk function.
i am trying to get starball off of the crawly crypt cd, plus a neat
looking game called DDSS,or something like that.
they both bomb out or freeze up on my mega4 with a 19 inch monitor board
installed.
could there be some incompatibility problems with the games, or do they
need to be moved over to a disk?
any help would be appreciated, thanks,
lance

Seen as you have 4 megs & a harddrive, why not install FreeMiNT or get
MagiC 6 -- that'll kill several birds with one stone...

<http://magicos.de>
<http://freemint.de>

...and while you're at it, vist:
<http://www.atari.org>

Later,
Karlos.

Hmm! You are clicking and dragging the actual program or program folder,
and NOT the disk ICONS!

We could do with a little more info: we know you have a mega ST4 and a
monitor. What CD driver, TOS/OS are you using etc.

I have with sad regret decided to use a PC(since I was given one for free!), I haven't yet had the heart to clear out all my Atari stuff which has been a large part of my life for many years, I was wondering, is there a Atari emulator for the PC(Win 95 set-up)? I do miss programmes like Oasis which enabled you to read/write email and news messages off-line, though someday I will finally work out Outlook Express! I will still be a active reader of C.S.A.S, where so many people have helped me with my set-up over the years, the PC community don't seem to be the same somehow.

James

PS what is the IRC Atari channel nowadays, its been a while since I last used it and there is only a bot on it.

Neither of these will cure the XBIOS clock problem, unless something has chanegd in the past few months.

Go to emulators.com and download version 7.2 of gemulator. Set up can be tricky. It does not like certain programs. I turn off realplayer when I run it. It is not perfect and can crash at inopportune times but it is very very fast. I get about 8.5 times an STE on a P166 laptop. It will support screen sizes that the Atari never would but many programs will not work in these modes.

Hi James,

You can try TOSBOX. It's at version 1.10 now. It can emulate a 14 meg Atari with TOS 2.06 (It can also be configured to emulate lower RAM settings. ie: 4 megs. You can use ANY version of TOS (upto 2.06). TOS ROMs are in a file format now that can be found on the internet. TOSBOX will work in a pure DOS environment or even Win95/98

The URL is:
http://www.emuclassics.com/tosbox/

There are other Atari emulators as well designed for specific tasks. ie: gaming.

Hope this helps.

g'day

: I was wondering, is there a Atari emulator for the PC(Win 95
: set-up)?

Better use the W98SE (Second Edition) as oS, it's bugfixed, has more drivers, etc. It has no disadvantages towards the W95. There's also the Windows ME (Millenium Edition), which is an even more enhanced W98. The Atari emulators all use many parts of the Windows OS, so you'd want as good a foundation as possible.

There probably hasn't been any changes to the code that needs to be changed. However, Magic can be patched quite easily to get rid of the problem since it completely replaces the OS including the XBIOS, where it appears the heart of the problem lies. FreeMiNT, OTOH, doesn't replace the XBIOS and requires additional programs to patch the underlying XBIOS.

Regards,
  David Bolt

Are there any emulators out there that do MIDI?. The only program I NEED to run is a MIDI Voice manager/Editor and I can't find one for the PC to do the same as the ST version.

I have the same CD and have the same problem. However, I can still copy the programs off the CD. I have Kobold and use it to copy/delete files. When I try to copy files from certain CDs (Crawly Crypt, etc) I get a message from Kobold that tells me it cannot access the files on the CD. It gives me an option to retry the operation in the GEMDOS mode. When I do this, I can copy any or all of the files onto my harddrive.

The opther option is the website address below. It has ALL of the Crawly Crypt files on it FREE for the download:

I have setup Pacifist for some people on their PC's and it works great and
ran every program I could throw at it. It also ran alot of games which is a
test for any emulator. Download it at this site:

http://www.pacifist.fatal-design.com/

TOS2WIN has MIDI capabilities, but correctly emulating a MIDI port (and the required high-res timers) is not easy, so it might not work with every MIDI program. However, I remember that TOS2WIN was successfully used with multiple sequencer programs.

I know MagicMac can do it. The PC version may well be able to. It's
commerical software from Application Systems Heidelburg and a search engine
will probably turn up a link.

Pardon me if I understood you wrong but you should not drag the
cd icon but rather only the folder you want to be transferred
or even only the single files since some programs indeed are
written so badly they only work when started from the uppermost
level of disk A :(

If your MIDI software is not too ressource-hungry, you should be able to
test that with the demo version (which is limited in memory).

Hi there,

just a general question:
Can I use a zip drive with my atari st 1040 (old standard tos,
scsi hard disk drive installed via acsi adapter card) ?
I have both, one zip scsi and one zip parallel, so I prefer the
solution that's easier. I guess scsi.

Thanks for suggestions,
  Oskar

Sure, just connect your SCSI Zip to the SCSI card and it should work just fine. I'm using one in my TT and it works without problems. If you have a recent version of HD-Driver you can partition the Zip-disks as TOS+DOS compatible, and they'll work fine with both your Atari and PC. I use this all the time.

Its very light, and it does not work under the demo version. I assume the
demo does have MIDI available?
I have set the MIDI devices to MPU-401, but the program just times out

fetching the SysSex dumps.

Yuk.............

The MagicPC pages make no reference to MIDI and it is not possible to
configure MIDI in the demo so I assume not.

Thanks anyway....

Hang on a minute. I've just remembered something. I'm sure someone was making a card for the PC which included the TOS ROM, MIDI in and out and a cartridge slot (for dongles). I can't remember who or what software it is so maybe someone else can help refresh my memory.

Might be some problem with direct hardware accesses - I would say bad luck, since there is practically no further development done on TOS2WIN. Earlier, I would have told you to mail the program to the TOS2WIN author ...

I would think you could. I would try HDDriver. It supports Zip and Jaz drives and does a good job at it.

I don't beleive it does direct hardware access. Its written in "C" and just does async I/O to
the MIDI ports. I guess that they are XBIOS calls. Its a long time since I wrote it....
Any way current strategy is to us PC program to get SYSEX dumps from MIDI and the edit
these in the ATARI program...........

That depends on the SCSI adapter, some of them take their power from the termpower-line on the SCSI-bus. But this guy said that he already had SCSI-drives, so the adapter already works...

Just to ramble on some more. I think I have now tried almost all the emulators, and wouldn't it be wonderful if they were all rolled into one. I think I like TOS2WIN the best, and would think about paying if the MIDI worked. After that its down to what you want it for. The hard disk -> FAT support in WinSton seems broken. It seem to write the files correctly but then can't walk the resulting tree. perhaps a problem with FAT32?.

Any way must go before my wife kills me ....

Dave Wade.

No problem here. Nowadays it's no problem to go with the stuff to someone who
does this for a living with Linotronik with REAL 2400 dpi for less or
comparable
money that anything with domestic laser would cost you.
It costs me 5DM to get one A4 photolit, which is so good that you cauld not
overexpose the PCB even with nuke explosion :-)
I mean, that black is really BLACK !
Also, a few mils traces are no problem at least for photolite...
It gets complicated when one makes film for each layer and then tries to mach
them.
Ordinary Linotronic imageseter never makes same photolit (with the same input
image) due to film transportation imperfections.
But that effects are much much smaller than with laser printer, no matter how
expensive and they can ussually be tolerated. If not, it helps to make several
instances of each layer on the film and to orient all of them the same way.
Better yet, you could go to the guy with machine that exposes film over special
drum imagesseter. These things do have excellent repeatabillity.

It could be done at home, but at the PCB prices of local houses, why bother ?
I'm wirewrapping a prototype now, so I could do TQFP-128 to something with
100mil raster pins adapter, but since it has to be easilly homebrewable, I
won't do it if I don't have to...

Friend of mine has connected Atmel's 2051 to floppy unit. He said that modern
floppies take care of everything time sensitive. One just have to make 0.5 us
pulses
1.5/1.5/3.5 us apart (negative logic)and floppy will shape them properly before
actual writing on the media. When reading back later, floppy will make nice
output,

rounded on 0.5 us boundaries.
Sounds like one of PWM outputs could do the writing and one capture port could do the reading...

I know - although prices around here are more around 10-20DM. However, I just wanted to say that you can do 0.65mm with home equipment without problems. If you have the possibility to make (or get made) a PCB with 0.5mm pitch, then soldering them is no big problem.

>It could be done at home, but at the PCB prices of local houses, why bother ?

Why wire-wrap? I find it much easier to first make an etched prototype PCB with most of the connections on it, and then only to wire the missing/wrong connections.

Hm - I would not rely on that, unless all floppy manufacturers specify it that way.

Is it stable with the Nemesis off?

Check the second oscillator on the Nemesis and be sure it is well
seated. Even if not used, that can cause problems.

Hi Jeff,

I had similar problems at one time. I also have Nemesis. My ram
board was having a bad connection with either the mother board,
or with the SIMM chip. I cleaned off all the contacts with a
fiberglass contact cleaner pen, or VERY fine sandpaper. Works
fine now. I have ram board from Wizztronics.

I think it's probably just a bad contact SOMEWHERE. Re-seat all
socketed chips. Other follow-up postings had good ideas. I
suspect that moving from one place to another caused a connection
to become iffy.

Good luck. Be patient, you'll track it down eventually.

I knew a Jeff Thomas in high school - you're not from Enumclaw,
are you?

I have a Hard Drive attached to my STE which is partitioned into C and D.
The C drive works fine, but the D partition loses files - even those which
have been visible for several days can disappear from the directory listing.

The only markings on the Drive are "Powerline Slimdrive SCSI Hard disk".

Any ideas?

Youre going to have to give more details, such as did it ever work
correctly. If so, use something like Optimiser to check for simple
corruption.

If its never worked right, is it correctly terminated?, are the leads
secure?, what software is driving it?.

It could be that it's failing to save files after a save, due to a bad sector or something similar.

If the drive isn't properly terminated, the computer MAY think that it's performed the task correctly when it hasn't!!!

Use a sector editor, Knife ST comes to mind:), and have a look at the root directory structure of your D drive. If there are filenames that are FULLY readable: e.g. program1, should read program1.

If it reads rogram1 with the 'P' part having a weird character then it would have deleted it and may have failed to write it.

Really a little more info would be nice as I'm having to guess as what would cause it to happen.

What hard disk driver are you using, what capacity is the drive and what make is it? Have you had this problem all the time or is just recently? Can you remember what you were doing when it starts messing things up...

Subject: Master Tracks Pro + Port B Box

Hi there list members, my first message to this list, and I hope I have got the posting procedure correct, so this is a bit of a test, but also a
message that we want feedback on.

We recently had a request from a two Musos who use Master Tracks Pro and wanted to know if Mario's MIDI3 box which suits Notator would work for Master Tracks Pro.

We have looked into it and have ended up making a suitable Port B Box as the the MIDI3 operates differently.

We were wondering if there is anyone else who would like such a box and so make the project more financially feasable.

I hasten to add that the simple DIY Port B Box does not work with Master Tracks Pro, this box is a complex circuit beyond a DIY approach, but necessary to have a working unit.

So this unit is costing $80 (usa dollars), and while I am about it, please
don't reply complaining about the cost, this is a fact of the low production, but worth it for Atari aficionados. Maybe there is a unit now
available that works with Master Tracks Pro, then please post about it.

What we want are orders as I am actually making this unit as I speak.

If you have any suggestions of other lists where I could post this info about the Master Tracks Port B Box then also, please post up your help.

If you would like to hear the inside story of this project then post here
saying so and I will post up the interesting saga.

Incidentally, this is being typed up on Mario's TT030, using his newly

developed graphics card running in true colour on a 21" Radius high
quality graphics monitor...

Do yo have some electronic experience ?
If not, don't be too optimistic about outcome...
Fuse is on the PCB of the PSU, so everything will have to be opened.
Besides that, fuse inside PSU usually does not die alone.
If fuse is bad, there is good chance you can expect more troubles, either in the instant you power it up, or later...

If you are determined to repair it and can hold soldering iron without getting killed, there might be several things to do, but there are no guarantees...

There is a fuse on the PSU. Turn the ST over and remove the seven screws in the
square holes (four at the back, three at the front). Turn the ST over,
make sure there is no disk in the drive and take the top off (lift the left side
first). On the PSU there is a fuse. I don't know what the rating is.
I think the fuse is in a holder and isn't soldered in. If it is soldered in then
you will have to use a soldering iron.

Have you checked the fuse in the mains lead? Sorry if this sounds like an insult to your intelligence!

Good Luck.

Hi all. Thanks to those of you who offered your insights to the possible problems that I had with my Falcon. I hauled the bird into work today and tried it out there. Only Geneva made it crash. I'm not sure if it's a conflict between the Nemesis and Geneva, or if it's just the previous crashes screwed up Geneva in some critical place. Neodesk 4.05 on it's own is rock solid. MagiC 4 ran well, and the base TOS ran smoothly too.

I work in a school which teaches digital media technology and production, so the place is well set up for computing equipment. My suspicion is that the power in my house isn't clean, that it fluctuates a lot, and so a big enough dip, takes the system down.

So now I wonder about ways to clean the power comming in.

hi Jeff,

well, it looks like you found the problem! Which is a big relief on my part :)

regarding getting proper "clean" power to your Falcon in your residence, you might want to consider investing in a line conditioner. This is a device designed to plug into a wall outlet which then puts out a constant 120v to anything plugged into it, they're very popular with musicians and sound reinforcement professionals. Most music stores with a PA department usually sell these, the one I remember was made by a company called Juice Goose that came in a 19" rack with five or six outlets. I wouldn't be surprised if a company like APS made a computer version as well.

Hi !

It seems that Pure Software bought the license for the standard C librairies
from Borland.
So you can see Borland on Turbo C for ATARI (note that Turbo C was also the
name of one of the first Borland C compiler on PC)
After, Pure Software decided to call it "Pure C", but the standard
librairies are licensed by Borland.

See you, Jean

Hi there everyone!

I've got an old Atari STE 1024, and a bunch of files that I would like to transfer to my PC, so my question is does anyone know or can anyone tell me where I can find information telling me how to transfer the files and what hardware / software I will require.

If anyone out there can help I'd be greatfull,
Thanks,
Malcolm

Hmmm! where have I heard this question before:))))

It's very easy to transfer Atari files over to your pc by several
methods.

The easiest is to get a 720k double density disk, NOT an HD pc disk,
formatted by your pc. Then just use your Atari to copy the files on.

I use a program called DC Format 3.0 which allows me to format a disk on
the ST and then make it ms-dos compatible, you can even use an extended
format to gain more disk space.

I always have 3 disk knocking around just for moving small files between
pc and Atari!

DC Format can be got from the following address:

www.steverosie.demon.co.uk/programs/dcform3.zip

The STE can read 720K DOS formated disks. In fact it can format 720K
floppy disks that can be read by a PC.

Hm!!

>Are there any Applications, Utilities, or any other Atari software
>that will not work correctly if the LINK II is being used

The only problems i had with ICD was when i installed MAGIC, it doesnt like non-AHDI partition schemes.

>Seems I remember reading that a few programs had problems but not

>sure on this.

The only prob i ever had was as above.

>What versions of HD Driver will work problem free with the ICD LINK II
>on a 1040STE or MEGA STE?

Any HD-D version will work, but obviously the latest version will contain bug fixes and latest inovations.

>Also, if I were to remove the internal Hard Drive hardware from a
>Mega STE and use a ICD LINK II. Would the MEGA STE know that the
>internal hard drive hardware isn't there and try to boot from the
>ACSI DMA port or would I need to set some hardware switches in the
>MEGA STE to do this?

It would know yes, as youve removed about 9 links in order to fit the origonal adaptor, incidentaly, these would need replacing in order to use an external device.

Also with a Link and HD-driver you could get faster ACSI performance with some drives, a switch is available in HD-D for this.

--

Regards from STEve & his nice warm cosey PAK'd MegaSTE.
* MegaSTE 40Mhz 68030, 68882 FPU, 4+16 Meg RAM, SCSI II, MV-300 *

Try the following for instructions on how to make a ST to Scart lead (RGB). This can be used on the MK1. I haven't made this lead up myself as my scart lead still works. The connectors can be brought from Maplins.

 http://www.algonet.se/~guld1/hardware/atari-scart.html

The MK2 ? I should (hopefully) be getting hold of one of these at the weekend from someone who is getting rid of his STE. If I do get the monitor I should also get the lead for it. If this happens I may be able to open the lead up and give you the pin outs. If I remember correctly the MK2 had a 15 pin VGA type connector and it didn't provide the sound - these were provided by the phono-out jacks under the STE power switch and went to the MK2 phono-in jacks.

According to a gaming magazine I just read, Hasbro *ONLY* paid $5 million for Atari's entirety. This now means that a buy back is NOT outside the realm of possibility. Afterall, the computer division surely is only one small fragment of the whole, no?

It's hard for me to believe that the next president of the United States will be George W. Bush or Al Gore. Both remind me of Hollywood movies that have been focus-grouped to death: they push all the appropriate buttons, but have zero original vision. Both stand for the same thing: corporate-driven business as usual.

There must be some way outta here.

Ralph Nader is no joker or thief. I think he and the Greens could give Al & George a good run for their money. At 65, Nader isn't running as fast as he used to, and the Green Party doesn't exactly have its platform figured out, but I think they have what it takes to inject a dose of radical democracy into the race. Unlike the two Tweedles, Nader is real, he stands for decency and common sense and he still commands a lot of respect in progressive and activist circles. And hidden behind the rainbow coalition of lefties, eco-feminists and crazies, the Green Party does have some great ideas. It's the only party that stands for the Tobin Tax, true cost markets, media reform and putting corporations in their place.

In October, with a fired-up Nader hurling intelligent sound bites into the presidential debates, the whole game show might actually be worth watching. The alternative is the most sophomoric presidential race in American history . . . and the lowest voter turnout ever.

I'm putting a GO GREEN - VOTE NADER graphic at the end of all my emails from now on. I'm betting that, between now and November, the American people will wake up to the fact that their sacred democratic experiment has now degenerated into a choice between a corporate-sponsored Republican and a corporate-sponsored Democrat.

In these heady post-WTO days, a sudden, massive protest vote against Al & George is entirely possible and Nader would be the most apparent heir. With perhaps less than 25 percent of the people voting, an inspired Nader campaign could grab a surprising share of the action. And even if he does not come close to winning, at least imagine how his campaign might pull together some of the fired-up, post-WTO forces and lay the groundwork for something really visionary in 2004.

Download the graphics and help launch an email pyramid scheme to dump the Tweedles! Two formats are available, a magazine sticker (17K) or a Banner ad (5K):

===

What it Means to be Green

"At the root of all Green political action is nonviolence, starting with how we live our lives, taking small, unilateral steps toward peace in everything we do. Green politics requires us to be both tender and subversive. Affirming tenderness as a political value is already subversive. In Green politics, we practice tenderness in relations with others; in caring for ideas, art, language, and culture; and in cherishing and protecting the Earth. To think Green is to build solidarity with those working for social justice and human rights everywhere, not bound by ideologies."

-Petra Kelly

Hi

I don't know if anybody can help I've had an Ste for the last 9 years or so but it got packed away when I bought a PC , I now have it set up in my bedroom with the monitor and Harddrive , running just fine again , I'm running KaosDesk , with 4 megs and I was just wondering is there a software patch to bypass the Y2k issue on the STs? I'm currently running in1980 , which is a bit annoying .Also is there anyway of getting my hands on TOS 3 either software or hardware and getting them running on my STe???

thanks for any help.

TOS 3 is strictly for the TT - it requires TT hardware that doesn't exist on an STE, and uses 68030 code that will not work on a 68000 (you should get an "illegal instruction" exception from the processor - which will generate a four bomb crash)

The only TOS upgrades that I know of for the STE are:

    TOS 1.6 to 1.62 or
    TOS 1.62 to 2.06 or
    TOS 1.6 to 2.06

Does the y2k problem occur only in certain software? For example, the desktop displaying odd years/dates for various files? Or is it confined to only certain programs?

(I had a small y2k problem with the desktop supplied with my TT [running TOS 3.05] and wrote a small patch in January which seemed to fix it. I don't know ifd it would work on an STE. If I can find it, and if I can get an STE to try it on, I'll report back on how well it works)

i have a mega st 2 with a monochrome atari
monitor. The black edges around the monitor
picture have gotten bigger over the years and
it's now at the point where 50% of the screen is
black and only a very small picture remains. Is
there any way of enlarging the picture again ?
Maybe something within the casing ?

thanks
Ronald

Take a look at power supply voltage inside the monitor. If your monitor has ordinary iron core transformer with linear PSU it can be that voltage is too low. Otherwise, you could try to correct this with trimpots on the main PCB. Ones for vertical geometry are at the edge of the board near the PSU and they are nicely labeled (look for "vert. size" or similar marking). After that look for group of trimpots in the low left corner of the board, looking from the back side. One of the trimers affects horisontal size and other affects hor. position. While you are at it, you can play with focus also, to get the maximum sharpness at desired brightness level.

Regards,

Branko

BTW: You should off course be aware of dangerous voltages inside monitor and so refrain from opening it if you are not qualified for servicing etc.etc. bla bla....

Yo,

Have you ever taken a look at the Atari clones.
They are not best on PC boards but custom design systems.

Hades by Medusa Computer Systems: http://www.kingx.com/kingx/medusa/
Milan by Milan Computer GmbH: http://www.milan-computer.de/

If you could out do these computers with great driver for Voodoo, Matrox, Diamond Viper and ATI Pro Rage in PCI, ISA, AGPx graphic cards. Support USB, Firewire, and SCSI-3. Support SoundBlaster, Creative 3D, Diamond in PCI sond cards.

Do all this and be backward supportive of all of the ST, STE, TT and Falcon software.

You would have an Atari ready for the new real world.

Best of all YOU will have do what Atari never did.

The best I would like is support for current graphic and sound cards on the existing Atari clones.

Raymond

Hi,
I just got an Atari 520 ST, but without power supply and everything, just the computer.
Now I need a little bit of information:
- What is the pinout of the Power connector?
- What is the pinout of the Floppy-Connector and can I connect a standard-PC floppy disk drive? Or do I need some logic board like in Amiga external disk drives? If so where do I find schematics?
- What is the pinout of the Monitor connector and can I connect a standard PC Monitor there?

Thanks,
--Michael

You don't need any adaptors. Just a 720K (not a 1.44) CMOS low power drive.
The chip on the ST won't drive "Standard" drives". Pin outs should be on net somewhere
or I can scan in if you are stuck.

> - What is the pinout of the Monitor connector and can I connect a standard
> PC Monitor there?

It wants PAL RGB. Don't have the pin outs to hand but you should find on the net.

>

Thats o.k. However can I suggest you look out at QXL.NET or similar for an
STE with SIMMS in it (some had SIP RAM).
That will have built in PSU, working (hopefully) 720k drive, later operating
system, and perhaps even a Scart/Peritell lead.
And it should cost you a lot less than trying to fix up the missing PSU and
Floppy Drive. There is one in the UK at 20 pounds.
(I guess about 60 Dm, you are in De land arn't you)

Dave.

Ok, I found the pinout for the 14-pin floppy connector and the monitor
connector. But I couldn't find anything on the power connector. I just need
to know what voltages should be on what pins.
Do you know if Amiga disk drives are low power cmos drives?

The external psu you require is type PS31. p/n CO 70103-3
Input :     240v~ (or 110v ~) /50-60 hz/ 38w
```

```
Output:     +5v dc @  3A
               +12v dc @ 0.03A
                -12v dc @ 0.03A
```

From the back of the ST. looking at the power in plug and presuming it is a
7 pin DIN socket (U arrangement)
then the pin out from left to right is:

+5v , +5v , +12v , (middle pin not used) , -12v , 0v , 0v

Hope this helps

Ian

If you knew Atari Computers was alive again, and that a 68060 or PowerPC system was available for $1,500 or less, would you buy it? If not at that price, what price/features would interest you to buy it? Would an affiliation with Hasbro cause you to doubt the quality or not? And would that doubt cause you not to buy for any reason whatsoever?

Jared

Greetings,
Appreciate any info on how to cure an error message
TOS Error Message #35
that is encountered when loading software on an Atari 1040STF.

How can this error be corrected? Do we need new system software loaded? Is this the result of a bad chip?

Any reference for a list of errors for TOS?

Any help appreciated.
Please reply to Laura at scctv@cruzio.com

Hi Ronald

>i have a mega st 2 with a monochrome atari monitor. The black edges around the
>monitor picture have gotten bigger over the years and it's now at the point
>where 50% of the screen is black and only a very small picture remains. Is
>there any way of enlarging the picture again ?

If you are losing width this is a possible sign of capacitors dying in the Line Timebase, or maybe the core of the width coil has crept down, try adjusting that with an long insulated tool. If the overall picture size is shrinking then the problem is in the Power supply, again probably dried out capacitors.

Ussually means it cannot write to the drive, i.e. cdrom or disk full (write protected). Some programs just need a little room to move:-)

That's the catch. There is NOTHING wrong with the added card.
I use fabricated double layer PCB (not homemade wirewrap or something like that).
I solder two rows of 32 socket-like pins on the CPU and then just socket-in whole card onto the CPU, so that I can remove it in cases like this.
Card worked without problems in other ST and the card from other machine gave me exactly the same problems as first card...
There is probably no point in removing IDE interface as it works 100% O.K. with TOS 2.06 as with old TOS. Just to be safe, I have deactivated it on card and removed IRQ line and old problems remain.

Funny thing is, old TOS works with floppy rock solid 100% reliable even with card on and with functional IDE interface.

After many hours of senseless glaring at the screen and opening various folders on the floppy it seems to me that DMA chip (which has 64 word FIFO buffer in it) sometime just has hickups and every now and then some byte that has gone into the FIFO does not quite make it to the exit, in whole or just some of the bits...
Another sign of that is that two O.K. DMA chips behave quite differently in the same machine. So, something must be working at its limits....

As I said, this problem has two interesting sides:

1. DMA chip problems. DMA chip is not quite simple "Coca-Cola" design and
designers obviously had timing and other problems. Evidence to that various simple changes around it on almost every successive board version.
This affects working of this particular machine, but no big deal, I will get around it somehow...

2. It's obvious that old and new TOS use quite different approach to transfering to/from FDC chip. This is very important issue to me. If new TOS could be recompiled or changed in order to use old approach, it would simplify design of various TURBO,etc. cards SIGNIFICANTLY.

I'm primarily seeking answers to the second side to that problem, even though direct answer to the first issue would save me some hours of work...

Thanks for your time,

Branko

I have a Mighty Sonic 32. Isn't the Eagle Sonic just the CPU upgrade? No problems (now) with this unit and it's about 8 years old, running with a Nemesis and NOVA attached. It did take a bit of tinkering when It was first installed however.

It works with nemisis? Wow. I just got a dead Falcon with one in working,
not bad. I was wondering if any body new of any CPX's to set the cpu speed.
The 32MHz.prg is annoying. Got it working alot better now though.

Mark Bedingfield

PS what speeds do you get out of Nemisis with this board?

I'm having alot of trouble with a Falcon I just bought second hand. I know the person who sold it to me and he had no trouble with it, but when I brought it home and plugged it in it has been constantly crashing. Sometimes with 2 bombs, sometimes 4 bombs, and even up to 14 bombs.

It can crash right away at boot, or sometimes will run for a long time before just hanging (no bombs even).

This Falcon has a Nemesis, and a RAM Gizmo in it. Those are the only modifications that have been done to the system.

We tried the various drivers for the Nemesis, but it doesn't seem to help. Except for making 640x480x256 colour mode a little more stable.

I've tried it with a VGA, SC1224, and a SM124, and it crashes with all of them.

I even tried plugging into a different wall plug. I'm at the point where I'm thinking of hauling it into work to see if it's a problem with dirty power in my house.

Anyone have an idea of what could be the problem?

bfn...

About two month ago my Falcon showed the same symptoms.
The reason was a soldering point near the SDMA chip that had gone
bad due to physical stress when I moved the motherboard in and out
of its tower. So the only help was that somebody with the necessary
equipment found the bad connection and resoldered it.

Hi

I've got a couple of disks to shift, well 1,000 or more. They all have pd or shareware on from the 'former' LAPD PD library and will sell them in banks of 100 ideally in the UK as postage from here is likely to be expensive.

They are sold on a first come first served basis.

The cost �7.50 per 100, plus postage saving �142.50 (based on 100 disks @ �1.50 each).

```

Some of the problems at first with the Mighty Sonic had to do with the inverter on the left side of the card. Once changed to an LS series, DMA and system clocking became much more stable. "Chip's and Chip's" (Michael Ruge) details that fix, and think that Robert may have some information in the DoitF030 archive that I sent him. Think that I sent some benchmarks with the files, pictures and abit poor worded text file. There is also another fix that the Mighty needs before you can add an expansion card atop it. Some of the traces for the headders were not brought through the card. You will have to get an Ohm meter and trace the pins from the bottom connector to the top of the headder to determine which ones would need to be jumped from bottom to top. AIRC, its the headder closest to the simms. Maybe 4 or 5 will need repair.

The clock switching for the Mighty Sonic is on the card itself. Doubt that any other available software would cause it to switch from the expansion clock output (BUS clock) to the output from the main motherboard clock. Most other cards use the keyboard chip to signal their own circuit for clock switching.

AIRC, I used the DSP line on the Nemesis to feed the Mighty where it (Mighty) would normally be connected to the main system clock. I clock my DSP with it's own clock at 50Mhz. Mighty is very stable at 40Mhz, and will run at 42Mhz (second clock on the Nemesis), but the SCSI and floppy DMA won't work at that speed (42Mhz). I've played with many clock patches, and nothing will allow it to run over 42Mhz. Actually, I found the same results with my Afterburner. 42Mhz is about max. If you use the Nemesis (not really necessary to speed it up, Peter Greens CPU accel will work too) do not use the capacitor or resistor modification on the input of the DMA chip, just a carefully routed wire from the buffer mod to the DMA clock input.

32mhz.PRG shouldn't cause any trouble run from the autofolder, should be invisable to you. I always start out by loading fast ram (FAFAXX.PRG), then 32mhz.PRG, load the Nemesis cookie, set the nemesis to HI then get NVDI loaded next.

The FPU is touchy. In some systems, the FPU will fail if accelerated with the CPU/bus. I have a 40mhz PLCC that I clock at 64mhz. The machine doesn't realize that true speed, but it was the only clock (and I have a shit load of them) that would allow the FPU to work at all with the Nemesis at 40Mhz. The FPU will pass a benchmark test, but may fail an accuracy test. Be forwarned that MiNT frowns on this, and will halt the system if it encounters an FPU error. A real pain in the ass, IMHO, for a machine that's only use of the FPU is usually rendering. TOS has no problem with the FPU errors. Unfortunately, CAB (or the OVL) utilizes the FPU, and under TOS, doesn't have a problem, but under MiNT, CAB will crash with an FPU error regularly. All of this only applies with the machine running over 32Mhz. Under normal 16/32Mhz operation, it is flawless.

If your card isn't one with fast ram,60830 only, you may be able to get more speed than I can out of mine. I think the problem with the Mighty Sonic and Afterburner lies with the programmable logic chips on the card no being able to handle much more than a 40Mhz clock.

Thats about all I can think about for now.

Mike

Thanks Mike, I have seen the Phantom board floating around and was considering using it. My FPU is only a fickle 16MHz chip, I probably wouldnt overclock that too high. The 030 in the Eagle card has no bass through and is a big PGA 32MHz type. There is a V8 GAL on board and there is also a 74xx chip which looks to have been modified at some stage. I seem to have also figured out the right combination of prg's to get the sucker working. I also note that there is a jumper on the card any ideas?

Thanks for your help

Mark Bedingfield

Hi.  I just noticed this in your .sig file.  You say aICQ.  Does this
mean there is indeed an Atari version of ICQ?  What are the reqs for
it?

Hi
```

If I remember correctly, the only reqs are: Atari or compatible and
Stik compatible dialup (Stik2, Sting or Gluestik). Go to the homepage
of Gokmase and check it out: http://gokmase.atari.org

No, I haven't seen that card before, and my instructions from GE Soft
don't cover that model. Can you trace it out?

Shoud be able to run the FPU at 32Mhz.

Mike

I found that some of the TOS readers for the ST's won't read the complete 512K from Falcon TOS. TT-Digger has a feature to create a ROM image. There is also a German language disassembler that will also read a TOS 4.04 ROM image, but the title escapes me. Both applications, in my case, created slightly different ROM images. Have to ask the authors about that.

Mike

I suspect that one or more socketed chips have come loose, or perhaps
there is a cold solder join or even a broken trace somewhere, and the
move to your place has caused a bad contact.

Open up the machine and push down all chips in their sockets. Do the
same with the Nemesis adapter. Don't know the RAM Gizmo, so can't
advise.

TT-Digger doesnt produce binary files, I am afraid, only assembly.
When you reassemble TT-Diggers output, the result may differ slightly from
the original. This is caused by optimizations done by the assembler which were
not done to the original.
When optimizations can be switched off, every bit should be the same.

The RAM Gizmo and Nemesis don't like each other. Either find
another RAM board or try soldering extra GROUND lines (short)
from the most far away points of the Gizmo to the motherboard. I
have the same setup and the extra GROUND connections remedied
all problems.

Regarding the ICD LINK II Hard Drive System Software.
Are there any Applications, Utilities, or any other Atari software
that will not work correctly if the LINK II is being used with
ICDs Hard Drive Software?

Seems I remember reading that a few programs had problems but not
sure on this.

I'm using version 6.5.5 on a SCSI hard drive that was partitioned
with HD Driver on a 1040STE/4megs/TOS 1.62.

Whats the latest version of ICDs LINK II hard drive software and
are there any major features I would be missing out on if I don't
upgrade to it?

What versions of HD Driver will work problem free with the ICD LINK II
on a 1040STE or MEGA STE?

Also, if I were to remove the internal Hard Drive hardware from a
Mega STE and use a ICD LINK II. Would the MEGA STE know that the
internal hard drive hardware isn't there and try to boot from the
ACSI DMA port or would I need to set some hardware switches in the
MEGA STE to do this?

If you post a reply, do e-mail me a copy of the posting too.
Thanks in advance for any help,

You shouldn't have problems, I've been using a Link II for ages.

I've used HD driver formatted drives with NO problems at all.

V3.0 onwards. I'm using version 7.0 at the present and have used both for some time with no ill effects.

You'd be better getting the latest version as it has facilities to format so that you can read and write via a pc AND TOS; if you need it:))

>Also, if I were to remove the internal Hard Drive hardware from a

My mega STE doesn't have an internal drive and I just use it as I would on a normal ST/E, via the hard drive port.

IIRC is treated as a drive along with anything else in the SCSI drive chain. So whichever drive/partition is set to boot, will be boot from.

Using an Atari properly without a mouse is virtually impossible. You should
be able to buy one from system solutions:
http://www.system-solutions.co.uk/atari.htm

An A-Z of Atari help can be dowloaded from www.stsd.demon.co.uk/linnhe.html

1040STF means that unless it's been upgraded, it has 1meg of RAM for use.
This is enough for early versions of Cubase (below v3). Bear in mind it will
also need a mono monitor for Cubase, check with system solutions for prices.

MIDI ports are built in no need to buy an interface although a MIDI thru box
which splits the out MIDI into more outs would help if you have a lot of
gear, try the Philip Rees v3 or similar.

Overall, you might find it more effective to buy an old 4meg Atari system
with monitor form someone who is upgrading their set up. Try
www.sospubs.co.uk fopr SH Ataris.

You can also get a product called On Stage which allows you to use an Atari
as a MIDI file player *without a monitor* on stage: www.hands-on-midi.com

Good luck. Ataris are good machines, solid MIDI timing and easy to use.
Pete

All of the programs I originally ran with my 1040STe still ran after I
installed the Link II. Infact, my STe system ran better than ever after the

Link II system was installed. There may be some programs that do not run, but I do not have them.

>Whats the latest version of ICDs LINK II hard drive software and

I think the latest version 6.02, but I am not totally sure on that. I would imagine since it is not produced anymore (to my knowledge) the software it comes with is the latest version.

>What versions of HD Driver will work problem free with the ICD LINK II
>on a 1040STE or MEGA STE?

I have not tried that, but I do run HDDriver on my Hades 060. There is an option in HDDriver to highlight if you own a Link II, so I would think that any version would work fine with the Link II system.

>Also, if I were to remove the internal Hard Drive hardware from a

>internal hard drive hardware isn't there and try to boot from the
>ACSI DMA port or would I need to set some hardware switches in the
>MEGA STE to do this?

I would not do that, but I would add another hard drive using the Link II

Hi,
like subject line says, I�m searching for datasheet of ST�s sound chip,
but so far without luck. I have tried also Yamaha site, but they do not
mention anything that old. Maybe some die-hard atari user has it ?

Regards,

Branko

Hi Branko,

I don't have any data sheets for the Yamaha part. Is this related to
your problem with that IDE/TOS problem?

I've just remembered (but you probably know this) that the step rate
is halved in TOS 2.06 mode to 3ms. Whether that is causing any
problems I don't know. Have you checked the DS 0/1 signals from the
yamaha?

```

Not really, I'm Sinclair QL fan, so I usually multitask :-)
Just before the weekend I have managed to grab two MC68EC000FN20 and
said to myself that this would be good moment to start wirewrapping my own
turbocard.
I wanted to start just as any ordinary 16MHz-overclock projects on Vezz's
homepage, just done a little bit better, with decent PCB on which would be
also several other usefull things, like FPU etc.
But getting good speed gain at CPU working at 32 MHz or more and staying
compatible with everything else on the board of the ST has proven to be
difficult&expensive to achieve.
So, I'm thinking about emulating everything that remains in the ST board,
just with the new chips. I think I have found the route to getting rid of
that stupid DMA chip, FDC 1772, Shifter etc, but I do not know enough about
YM-2149 to think a way of replacing it.

I don't even need detailed hardware info (although it would be very
welcome), enough would be even register set with description of what value

in the register X produces what effect...
There were several emulators written for Spectrum Plus 128K and Atari ST
which emulate also YM-2149, so this information must be available...
All I need is this info and several miles of thin Cu wire to connect
everything :-)

All that is fine. Disk is selected, spins and reads the data, albeight some
1% of data read is wrong with TOS 2.06, while old TOS works 100%.

Thanks for the thougth anyway.

Best regards,

Branko

Hello.
Somebody sent to a spanish Atari mailing list a .txt document that has some
information about the yamaha sound chip. I will send to you.

David Galvez.

You could check out the General Electric support for their
equivalent. How about the Atari Bible that's online on a server
in Poland?

I'm curious, what will you use to emulate all those chips, a
DSP?

Thanks. I don't have that URL, but Altavista will find the way.

>
> I'm curious, what will you use to emulate all those chips, a
> DSP?
>

Yes. DSP from Analog Devices seems to be the right choice. I have
wirewrapped ADSP-2115, which is a bit weak with internal memory, but
should be enough for replacing Blitter, DMA and to perform colour
pallete emulation.
I have soldered on also AD473 RAMDAC, which is good for up to 135 MHz
pixel clocks and up to 24 bit/pixel, but it's colour palletes do not

correspond to original ones. So, the idea is whenever CPU writes to old
colour pallete register (where will be actually only ordinary RAM), it
triggers interrupt on DSP, which tidies things up.

I have also several pieces of ADSP-2181, which has many more bells &
whistles, and is real beaty, but has 100+ pins and is unsuitable for
homebrew projects.
I want to design thing so that average electronic hobbyist can assemble
his own.
It sounds strange, but FDC1772, both 6850 ACIAs etc could be replaced by
some modern PIC microcontroller.
That leaves only PSG 2149...

Branko

Ok, that is good enough:)
That jumper is for the expansion signal on the Falcon. You have to remove it to add another card ontop of the Eagle. Some expansion cards have them, some don't. Ones that don't have the pins shorted usually by a trace on the card rather then a jumper.

Mike

Try Actively terminating the SCSI socket...sounds daft I know but one of my Falcon's will run perfectly happily with a load of drives and unterminated cabling, the other won't even find its floppy disk without an active terminator...

Never thought of that. The card has no pass through anyway. I am toying with the idea of coupling this with the Phantom accelerator.

It all fits in a 22V10 GAL, but there is not much room left for other
circuitry. And no, since the idea was not mine, I can�t give details for
that design.

What not even how it works? What about some guidance, just how it
overcomes that problem.

How come there are so many modifications on the internet that just

switch the CLK from 8 to 16mhz, if this doesn't work why do so many
people have it?

It is the 32.xxxMHz oscillator that is pulled (not much, obviously, being a VCXO). The phase comparison is between HSYNC and the 4.433MHz clock, and the 32.xxxMHz VCXO (from which HSYNC is derived) is pulled accordingly.

That�s why the 32.xxxMHz crystal uses such a strange frequency - otherwise, they could have used a standard 32.000MHz crystal.

I guess it depends on how tolerant your TV is regarding non-standard FBAS signals.

>DTACK and it will be recognised at next rising clock edge.
>Trouble is that logic that generates DTACK does this with regards to the 8 MHz
clock
>and that is not cool. When DTACK is generated CPU should get off the bus in the
next
>CLK or so
>and DTACK should be deasserted at the moment that AS, LDS and UDS go inactive,
but
>that does not happen.

The problem is that the chipset (running at 8MHz) and theCPU will disagree about when various signals have to be released. For example, a fast CPU may see the DTACK, start the new bus cycle, and see the DTACK that is still not removed by the chipset, and so the CPU will think the next cycle is already done and read/write wrong data. Similar things can happen with other signals.

Such a modification may work, but the timing is critical and function may no be easy to reproduce in another ST.

>Not quite. Well, maybe on some "modern" 68HC000 or 68EC000 CPU.
>Old 68000 is machine with dynamic registers that demand internal refreshing and
>contains quite some analog stuff inside...
>This means that they must be fed proper clock signal which must be stable during
>operation.

Right. However, it should be enough to satisfy the maximum clock high/low periods, which ensures that dynamic registers still work. Since the minimum clock spec�d will not be 8MHz, you have still enough room to switch the clock glitch-free.

On the other hand, you will want to use a CMOS CPU anyway when going above 10-12MHz, so that is no problem.

>> The modified MagnumST works absolutely stable by switching the CPU between
>> 8MHz and 36MHz (and by doing this glitch-free - you can use *any*

>
>Maybe because of 68HCxxx instead of ordinary 68xxx.

Yes, sure. I would not trust a NMOS 68000 to run beyond 1.2-1.5 the
specified clock. However, this is independent of the problem of getting it
to run at an asynchronous clock at all.

Because it works "quite well" when using a *synchronous* 16MHz clock. I did
these modifications for falcons (32/16MHz in that case). However, it depends
on how well the CPU reacts to such a disturbed clock signal, and mostly
requires some fine-tuning to run on a specific board.

However, if you get it to run, is is a very cheap modification.

Hi!

Thats what I really needed to know. I found it improved a lot when
I put some 0.1uf caps across the logic chips. Before that it wouldn't
boot up but at least know it'll run quite a few programs. Thats
something you should do anyway.

When you say synchronous do you mean the 16mhz clock is in sync with
the old 8mhz signal.

I've had this too: it's frightening, isn't it? My solution is immediately
to shut down and COLD reboot: this always resolves the problem for me.

My problem is an external HDisk with partitions which HDUtility did
partition (K to R), but I cannot see P to R any more (MagiC 6).

Charles.

Yes. That�s the only simple way to avoid glitches and other synchronization
problem when switching between the two clocks.

You can either use a PLL, or use the 32 or 16MHz clock from the chipset.

Note that except for old IDE drives formatting won't do any harm but
it's simply a waste of time. As long as there are no bad sectors
formatting a drive doesn't make any sense.

Hi,

i had to konvert an Atari program to winnt.

I have the source but there is on Line
BIOS(99,2)
and i dont know whats it. It is something with the parallel port.
But i have no Documentation of the bios-calls.

Any Idea

manfred

As you'll probably read in zetnet.atarians, I've finally got it to work!

After trying many combinations of deinstalling, reinstalling, rebooting etc., it seems HDDRIVER (or at least my 'old' version) won't install properly over an existing, booted-from C, AHDI but only if AHDI has been booted from floppy. And only if you install AHDI first and then HDDRIVER over the top - you can't install HDDRIVER on its own. Curiously, HDDRIVER won't install either if you've booted it from its own floppy!

I'll never get the hang of these computers...

Hi!

True. So making a circuit that switched the CPU to 8mhz *only* when
it is accessing the bus AND/OR when DTACK is low. This should make it
a bit less glitchy. I'll fiddle around with this one.....

I've done something like this, ran it in an STFM for about 5 years now.
The circuit basically monitors AS, when AS is low, the 8 MHz clock is switched
to the CPU. when AS is high, the CPU gets fed 16 MHz.

This does not seem to cause problems, this CPU modification has only ever given
Only had to lift the CPU clock pin. 8 MHz is from the regular CPU source.
The circuit is very like the one used to switch clocks for the DD/HD disk
drive modifications.

I guess it works well because the two clocks are in phase & related in
frequency (2:1). I've looked with a 'scope, sometimes the clock is switched
mid cycle, i.e the 'high' period is 125 nS, the low period is 62.5 nS.

This does not seem to cause problems, this CPU modification has only ever
given me problems with one game (Sim City). Everything else worked fine.
This must be the cheapest modification ever, but the speed gains are not too
impressive (10% overall increase). ROM is accessed a little faster.

<<SNIP>>

>So how about just connecting +5v from
>*inside* the Atari computer itself!
>That way I'll have power for the host adapter without having to rely on
>the external units.

1st Method:
I would take the GEsoft apart and find the wire that supplies the power to it from external SCSI devices and cut the it. It might mean cutting a track on the PCB. Then take the end that goes to the chips in the GEsoft (not the external drives) and somehow connect it to the 5v supply from the ST.

i) You could put an external 5v supply on the back off the case and then have a little lead that goes into the GEsoft.(3.5mm mono jacks?)

ii) Mount the GEsoft internally so the power can be supplied with out wires going out the back. It will be neat and you'll have a nice SCSI port on the back.

>But what if I do indeed connect an "Atari type" SCSI device to it, where
>+5v is already supplied to that pin, and it also gets +5v from my
>computer! Surely this would cause an electrical problem.
>How do I solve this? With a diode of some kind where external power is
>blocked? Any ideas?

2nd Method:
Yes you could use diodes. Although they are both 5v there probably be a difference of a few milivolts which isn't good practice to have them shorting. You have two diodes, small ones will be fine. (1N4001)

DMA port >>>>>>> GEsoft <<<<<<< SCSI devices
The >>>> and <<<< are the diodes direction. You could mount the diodes in the case.
You still need to get the power out the ST though
so I would prefer Method 1 ii.

Hope that helps Hallvard ;-)

I think it does. I have been fiddling with such an adapter recently.

The adapter I have has a 2-pin connector to which +5 and Gnd. can be
connected. It would be far neater, of course, to make sure that TRMPWR (SCSI
pin 26) has 5v on it which means that it is available for dynamic
termination when required.

Might be better to set up one of the bus devices to "Supply Term Power".

This being said I must remark that my experience with the GE soft adapter
(if it is the same sort as yours) has not been happy. I found that modern
devices don't work well with it. For starters, they fail to "Identify".

Roger

I think that GEsoft made several types of host adapters. The one that I have in my machine HAS parity built in.   This adapter is a little board with two 19-pin ACSI ports (one for connecting to computer and another for daisy-chaining other devices), has one PLCC-shaped chip, a couple of bus driver TTL chips, and a parity-generator TTL chip. I have used it with success on an IBM hard disk and a Toshiba CD-ROM.

>2) I remember with my ICD Link II, I had problems making it work at

This board that I have has a four pin connector for power supply (2pins ground, 2 pins +5V), and a trace on the PCB connects 5V from this connector directly to TERMPWR on the 50-pin SCSI connector. So the adapter can be powered either from the SCSI chain, or from a separate source. There are no provisions to disconnect the two sources, except by cutting a trace on the board.

>But what if I do indeed connect an "Atari type" SCSI device to it, where
>+5v is already supplied to that pin, and it also gets +5v from my

>How do I solve this? With a diode of some kind where external power is
>blocked? Any ideas?

A diode might be a solution. But that small voltage drop on a diode may (or may not?) result in an out-of-tolerance supply voltage for termination. Maybe it would be better, as the advice has already been given here, to disable TERMPWR on the devices themselves. All this is relevant only if you use externally powered devices, of course. If everything is powered from the same supply there is no need to worry.

Btw. how about a plain switch, to disable/enable TERMPWR from the adaptor, when needed?

Cu.

In contrast to static termination where a simple resistor is used to match the bus impedance. A "dynamic" termination is more precise being a differential bridge but requires +5v (usually obtained from TRMPWR) as a bias.

Just that if +5v is available, either in the host adapter or from one of the connected devices, it would be neater to use this than rig up some flying wire supply. Most recent SCSI devices have a jumper which will get them to force +5v onto pin 26.

I have tried CBHD, ICD and AHDI. The devices which failed to respond are IBM DSAS 3600 HD, Archive Viper 250 Streamer and IBM 2x CDR (dunno what model no.). Unfortunately the GE adapter is the only one I have left now :-(

Roger

There is no such thing on a SCSI bus.

SCSI can be terminated by either a passive or active terminator. Both require a +5V supply (from TERMPWR, to be standard compliant).

A passive terminator consists of a 220 Ohm resistor from each signal line to TERMPWR, and a 330Ohm resistor from each signal line to ground.

An active terminator consists of an active low-dropout 2.85V regulator (which is fed by TERMPWR, and which must be able to both sink and source current), and a 110Ohm resistor from this regulated 2.85V supply to every signal line.

Active termination is required starting with fast-10 SCSI, but is no bad idea for slower SCSI systems. Active termination works better because (a) it keeps stable voltages even with variations and noise on TERMPWR, and (b) the 110 Ohm impedance more closely matches the cable impedance than the 132Ohm which a passive terminator achieves.

With a diode and a fuse in series, if the device is SCSI compliant - the spec only guarantees something around 4.5V on TERMPWR.

The standard says that an initiator (ie. a host adapter) *must* feed TERMPWR, and any other device *may* do so.

I'm currently looking for the same information. Nothing can be found from hitachi but I had some modest success with following links :

Great Microprocessors of the Past and Present
http://www.cs.uregina.ca/~bayko/cpu.html

then, follow these links :
http://archive.comlab.ox.ac.uk/cards.html
http://www.xs4all.nl/~ganswijk/chipdir/

You will find there that basicly the 6301 is like the 6800, and
instruction lists.
then, go to the motorola web site and search for the following keywords
:

search "MC68HC11A8" (the oldest 6800 clone that I found with
downloadable documentation)
http://mot-sps.com/mcu/documentation/pdf/a8.pdf

search "Understanding Small Microcontrollers"
http://ebus.mot-sps.com/collateral/M951446559720collateral.pdf
(seems to be a good introductory book on the MC68HC05)

Finally, look for the Sim68xx home page at :
Sim68xx Home Page - HD6301, 68HC05, 68HC11 simulators/emulators
http://www.geocities.com/TheTropics/Harbor/8707/simulator/sim68xx/
(the author must have some documentation, and at last you can browse
the code of the simulator).

Hope this helps
Bonne chance !

Laurent Vogel.

I am an electronic musician and for several years I have used my trusty 1040
STE for MIDI sequencing.
I have now upgraded a PC with Cubase Software.
My song arrangement files were on ATARI but I know that the PC cant read
ATARI Floppy Disks.
IS there anything that I can get that will make my PC read the ATARI
disks so I can transfer my files to the PC without loss of data?
Please help

Providing you ST has a 720K disk drive, and you format the disks in the PC then you should be able to use them on both systems just fine. If formatting via Windows remember to select 720K not 1.44.
There should be some Public Domain tools to do the format on the ST or patch the disks so they work on a PC.

I believe you can connect the two computers with a null modem cable and transfer the files like that. I've never done it before, but from what I've been told you'll need a terminal program on both ends. Maybe you could figure out what settings to use (I can't help you there) or maybe someone around here could tell you.

Hope this helps,
Andy Blakely

This are VERY basic questions. I recently picked up a 1050 disk drive and an Atari 800 XL computer.

1) How do I boot the disk drive? (I assume that there is a "run" command, but I wasn't sure what).

2) Is this dd compatible with the older Atari 800 system??

Thanks!!

Dan

Hi

I'd just like to inform those that are interested that I am moving:) So
if anyone is going to send me anything or request via snail mail etc..
It may not get to me:(

I also may be off-line for a few days, depending how sleepy BT is:)

If you need my new address etc. drop me a line with the following
'ADDRESS CHANGE', without the ', in the subject and I'll send it on
a.s.a.p:)

Hi

You need to boot the drive using an Atari DOS disk OR any disk if you
want to access BASIC and write your own programs etc.. in other words
just like a tape deck.

Many programs will run directly on boot up from disk, so nothing else is
usually needed; maybe to press option (boot without basic) or not!

The 1050 SHOULD be OK with the 800 etc.

<<Many programs will run directly on boot up from disk, so nothing else is usually needed; maybe to press option (boot without basic) or not!>>

Steve--

I haven't had any luck having the disks boot automatically (I'm hoping the DD is good!!!). Also, I could not get a cart to run using the XL...But it runs fine on my 800. But the XL appears to work otherwise. Is there a chance the cart port is bad (my apologies if I use any incorrect terminology...I AM a "newbie" afterall....). Do the 400/800 carts work on the XL??? Thanks for your time!

Dan

Format a disk double sided on your STE using GEM. The STE versions of TOS put a MS-DOS bootsector on the disk so your PC will be able to read this disk. All you have to do now is copy the files you wish to transfer to this newly formatted disk.

1/
For Sale.

- Hand Scanner 12 pounds

- Falcon up for offers - ask for details....

-load of software

- Atari ST Veloce set-up
   4 meg standard + 4 meg fast ram for veloce.
   HD Floppy,   56k serial port.
   1 gig hard drive with loads.... of software on.
   Link '97,   + Atari mono monitor. NOT SLITTING this set-up
   For 220 pounds or VNO.

Have moved to PC & Falcon.
All above to be collected (from Barnsley, Yorkshire)
or add P&P

2/
Atari 8-bit stuff..
 800XL`s - 256k, 2x PIA chips (extra 16 bit I/O lines)
           2x Pokey`s (stereo sound)
           + 2 standard
 1050 disk drives x2, 1010 cass, 1029 printer, 1020 printer/plotter.
 Software:-
  DGS pd disks, Page 6 disks, loads of others
 Mags:-
   Antic, Analog,
 Games on cass./ disks.
 User/ Field service manuals
 Can`t remember everything...
 Take offers......
  Barnsley, South Yorkshire
 STILL HAVE A FEW THING LEFT as there was more then I thought.
Karl

When repling tell me what you want + offer

>"newbie" afterall....). Do the 400/800 carts work on the XL??? Thanks for
>your time!

Well if they follow Atari rules, if you can call them that, most
cartridges should work on both types of machine.

Now 600/800xl..., 65/130xe's... are basically all the same machine and
have BASIC built in them. the 400/800.. had BASIC as a cartridge which
you plugged into one of the cartridge ports.

Also the xl & xe's only had 2 joystick ports while the earlier models
had 4!!!

Certain memory registers did different things in xl/xe's; e.g. one
switched the BASIC in and out. It is quite possible that the cartridges
may be accessing registers that were modified in the later models.

I can remember I did come across some software that wouldn't run because
it combined (eor) different binary numbers which were changed in the
xl/xe's!!!!

So by rights anything that runs on the xe/xl, assuming you have the
memory, it should run on 400/800!!!!

If you can get hold of 'De Ja Atari' (I think that's the name, it's been
a L-O-N-G time!), and also compare the original with the revised
edition; or even Computes! 'Mapping the Atari' you will see what I mean.

I regret I got rid of all my 8-bit stuff many moons ago including ALL my
source for my menu system, utilities and games:(, after feeling let down
via Page 6!!! Maybe one day I'll have another set up and start
supporting that platform fully:)

De Re Atari (which means All About Atari).

I'm pretty sure that there are online sources of this and other documentation.
I'd recommend that the original questioner joined the 8-bit newsgroups as well.

>I regret I got rid of all my 8-bit stuff many moons ago including ALL my
>source for my menu system, utilities and games:(, after feeling let down

I regret it too, I had many add-ons inside my 130XE which made it a very nice
machine indeed!

I never had to worry about the R/W pin. I let the CPU take care of this ;)
Then again, I do have faster memory, 60 nS SIMMS on a marpet board.

I would guess that 120nS devices are too slow @ 16MHz, however, the modification I used did not affect the speed the memory operates.
Remember, the CPU is the only device switching between 8/16 MHz, the MMU is unaffected. In all the tests I ran, the memory access was always 100% i.e. normal.

I did find the ROM access time was 15% faster.

It is possible there are some glitches on the board.

Did you modufy the board to run @ 16 MHZ (changed the master clock to 64 MHz)?

If anyone out there can give me advice on how to fix an Atari monitor, please send me a note.

Description: It's an Atari monochrome monitor, model SM125. The screen went black and the pilot light went out. On taking it apart I found the second fuse blown (not the main one). When I replaced the fuse it blew again, obviously the trouble is somewhere else.

Not having a circuit diagram I am groping in the dark. If somebody has any suggestion where to look, I'd appreciate it.

Please e-mail to al743@ncf.carleton.ca if possible, or reply in the newsgroup.

Think it�s an short in booster circuit. (Maybee defective booster)
SM124 diagram can be found online. SM125 never see�n anywhere.

Use "schematic" link on my link site.

Regards, Robert

Anyone considering the purchase of a Sony peripheral for their computer might want to give it some further thought. There clearly is not a reciprocal relationship between what they sell and what they service.
-
I purchased a CD-RW drive back in April that just recently went bad (won't read). When I called Sony service, I was told that I could not get a replacement and that I had to ship it across the country to be "repaired" (and we all know what that means...) - with a three (3) week turnaround. Assuming that they keep their 3-week commitment, with shipping both ways, I'd be without the use of the unit for at least five weeks!!!
-
I hardly think that's reasonable or fair.
-
Compare this to HP, who under the same circumstances would simply ship you out a replacement unit and issue a call-tag for the old one.
-
Sony is a behemoth in the marketplace and as such, they have an obligation to scale their service facilities to meet demand. To not do so is an indication of their lack of commitment to customer satisfaction and an unwillingness to stand behind their products.
-
Buyer be ware!

Simply formta floppy disk on your PC and copy your stuff via file copy
(NOT disk copy) from ST disks to PC disks.

Hi folks,

one weird thing is bothering me for ages now...
I have tried to get TOS 2.06 (with IDE interface) to work on friend's 1040ST.
I have made PCB and soldered it in machine, like several times before and it worked... at least on the first glance...
When trying to access floppy from TOS2.06 it behaves very erratically. I can't even read directory properly. It ussually doesn't report an error, just names in the folder are every time that i reload it a little bit different (some letters are wrong) and capacity of the drive indicated is pure nonsense. If I try to execute program from floppy, it crashes...

When controll is switched to old TOS (with new board still inside machine), everything works O.K.
Under TOS 2.06 everything else runs fine (IDE communication, memory tests etc...).

I have discovered that erratic behavior improves somewhat if I fiddle with 8 MHz CLK signal going to DMA chip (by replacing L/C snubbers with a simple serial resistor which gets me steeper edges with still no ringing), but it still does not work properly.
I have tried replacing DMA chip and other one did not work at all (but they are both O.K./checked in another ST).

I'm quite sure that it's something around DMA, but can't pinpoint it yet.
I'm not sure why old TOS 1.xx works O.K.
Could it be that older TOS versions transfer sector through CPU, while

2.06 uses DMA chip ?
If this is so, could the 2.06 be persuaded to use plain old CPU transfer also ?
This could be beneficial also for turbo card homebrewers like myself,
since DMA chip complicates things and is not of much use nowadays...

Any ideas ?

Regards,

Branko

Hi Y'all

Blimey its dead in here, lets wake it up.

There has been discusion lately regarding the boot-logo in Magic and how it goes to the default video driver output.

Could someone explain to me why my graphics card driver isnt the default
driver in the second phase of booting and why i dont get the logo then??.

news:3969412D.A2BFFC06@avtomatika.com...

: When trying to access floppy from TOS2.06 it behaves very
erratically.

There could be something wrong with your board? Try to move the
2.06 EProms to the sockets on the motherboard. You need to draw
one extra address line in the air and lay +5V on pins 1,2,3 an
32, provided you're using 32p 128kb EProms. Align your EProms to
the backs of the sockets, so that four pins in front stand out.

Also try a smaller solution without the IDE interface, just to
see if you can get the TOS part right. TOS 2.06 just needs one
74LS139 and one AND gate plus a diode to work. The AND can be
used on the non-utilized part of the 74LS11 (if present).

the reason that i asked this is because one of my customers is using 520 st's.and 1040 st's to power a stand alone flight simulator.
this unit is awesome, and looks like a real pilots cabin,and has 1224's built into it to show different scenes from a slide show from degas,and art&film director,plus flight simulator programs.
he would like to cut a 1040 out of the loop, and use just one 1040 to show different scenes simutanously.
from the answers that i have got,it sounds like it cannot be done,but just think of this,he is using atari technology to power this, and goes around to schools charging them to demo this for students.'
he tried pc's,but they were to unreliable,thanks,
lance

CGA *is* digital RGB. Could be EGA too, but you don't know yourself so I had to make a guess. The term "PC monitors" can be compared to the term "birds" in the animal kingdom, some are white, some black, some fly, other swim etc. Your buddy has likely tried an (S)VGA monitor, which by all means is a "PC" monitor, but an analog one.

Maybe it's time to surf the web and find out what that synth is made of?

Hi

If your hard drive is bootable just replacing programs onthe drive boot partition won't work!!! You can't stick hddriver.sys in the root directory and expect it to work.

Likewise don't expect any program to run from the auto directory if the original driver software has been removed (the .sys file).

What you will need to do is install hddriver on the drive WITH hddrivers program.

You can, of course, stick hddriver.prg in the auto folder of a floppy and it will run, but won't auto boot.

When you install hddriver using the program itself, it will remove the old boot system and install itself. All you will need to do is remove the OLD shdriver.sys file, but it's not essential.

When the hard disk drivers are installed, the software looks for a certain file in the root directory to load the drivers. This is usually the main driver.prg with an .sys extension. Removing this driver won't work as it's expecting a specific file AND how it runs.

```

>machines. Pal is 4.433   NTSC is 3.579.

Right. It is not exactly 32MHz but a bit more, and the 32MHz oscillator *is* part of a PLL - it is locked so that the 4.433MHz clock is a multiple of the H-Sync rate (which is derived from the 32.xxxMHz main clock).

>>You are essentially correct, however, I found that the ST did not like the CPU
>>running at odd multiples of the bus with my overclocking circuit. I tried the
>>CPU @ 24 MHz while the bus was still @ 8 MHz, it did not work.

No wonder: the CPU does not have the bus alone. In the ST, CPU and chipset (for video access) share the bus 50/50 of the time, so the CPU can't access the bus anytime it wants. This only works if the whole stuff is synchronized.

Running the CPU asynchronously is possible, but requires a bit of effort (I have a 16MHz 68HC000 running at 36MHz on y modified MagnumST card - the CPU runs at full speed while accessing the fast ram, and is switched down to synchronous 8MHz operation when accessing ST-RAM).

>So having a 16mhz accelerator like yours isn't as good as it sounds
>(not saying its rubbish) because every time the cpu needs to access
>other chips it has to switch done to 8mhz mode. Would it be possible
>with a few GAL chips (or normal logic) power the CPU at 16 (32?) mhz
>when not accesing the bus, but then when it access's the bus it drives the
>CPU at different speeds for the different chips its acccesing.

Yes, that is possible. The german magazine c't had such a project quite some years ago, which worked fine for 16/8MHz operation.

However, because the 68000 CPU has no cache, and there are only few CPU instructions that do *not* need to access the bus, the real speedup was only in the order of 10-20%.

Later there came accelerators with cache (usually 16-64KB). These could provide up to a factor of 2 in speedup when running at 16MHz.

>Yes we'll keep it without cache at the moment. Keep it simple for the
>time being.

Without a cache, you won't gain much on a CPU which does not have an internal cache. Even on a falcon with a 6830 with internal cache, doing this kind of modification (32MHz while not accessing the bus) gains a remarkably low performance gain.

>144! Quite a long way off RISC technology!

Right. However, these instructions are rare in real programs.

>Hmm. Motorola never AFAIK made a 68000 more than 20 or 24mhz. The
>T28 clocked the CPU to 28mhz and T36 to 36mhz although I have never
>heard of a T36 being used. Might have been too unstable. With it
>@64mhz you would need a heatsink and fan.

Only the CMOS versions are overclockable more than a few MHz. The 68HC000-16 here runs fine at 36MHz, but does not get hot - so a heatsink will not help, and it does get unstable at higher clock rates - which means the speed is limited by chip-internal circuit delays, and not heat.

What is the chipset (shifter?) So 32mhz would be fine for the CPU.
Basically the CPU has to be in sync(or even multiples) with the chipset.
Is that correct? Are you assuming I wanted to drive the CPU@24mhz
WITHOUT taking it down for to 8mhz on bus cycles (the AS low)

>Running the CPU asynchronously is possible, but requires a bit of effort (I

So how did you get 36mhz? What was the circuit?

Yes I know about how poor a performance of 16mhz without cache gives.
I wasn't interested in just clocking the CPU to 16mhz. I wanted to
speed the bus up as well with a few components (DMA, MMU....)

Cache can come later. Access it at the same speed as the CPU. I have
to get the bus running faster first!

>Only the CMOS versions are overclockable more than a few MHz. The 68HC000-16

Point taken, thinking about Pentiums-they need these massive cooling
systems and fans. Not suprising with all the Millions of trany's.

Hi Mika

The answer is yes. Put the same amount of DRAMs in the left side and solder them in the right bank. Make sure you place them in the right way round.

Patience is needed because if I remember the holes aren't clean (filled with solder) so you'll have to get rid of that solder some way.

Also on most 520 STFMs some resistors are missing just below the DRAMs. There is a line of about 9 I think. A few more need to be soldered in. These are the control lines for the right hand DRAM bank. Next to each DRAM chip you'll see a space for a capacitor, like on the left hand side. Use ones like on the Left hand side.

I think there is a document specifically for doing this on Vezzs hack side. (sorry don't have the URL OTTOMH).
Also documents there for indtalling 4mb into STFM.

Good Luck.

Nope, you just have to fill the extra bank.

> This seems confusing
> to me...Isn�t the only difference between 520 and 1040 the memory size,
and
> does the 1040 have 2 full banks of memory?

Correct. Whether the job is worthwhile in this day and age is another
question. It's easier and cheaper to get you hands on an STE and max it out
to 4Mb with SIMMs.

Shifter, Glue + MMU - they all work very tightly together, so can�t really
separate them, although they are split across multiple chips.

>Basically the CPU has to be in sync(or even multiples) with the chipset.
>Is that correct? Are you assuming I wanted to drive the CPU@24mhz

>WITHOUT taking it down for to 8mhz on bus cycles (the AS low)

The chipset neds to have control of the bus whenever it thinks it does have
it (ie. as in a 8MHz system), and you can not speed up the CPU->ST-memory
cycles, so your speeded logic must look to the rest of the board liek a
normal 8MHz CPU. How you do that is up to you ;-)

>>Running the CPU asynchronously is possible, but requires a bit of effort (I
>>have a 16MHz 68HC000 running at 36MHz on y modified MagnumST card - the CPU

>
>So how did you get 36mhz? What was the circuit?

From a completely asynchronous crystal oscillator. I used a GAL to switch
the CPU clock glitch-free to 8MHz when accessing the ST-RAM, and let the CPU
run at 36MHz otherwise (including fastram accesses). The logic of the
MagnumST ramcard was modified accordingly to run at 36MHz without waitstates
(which is possible using normal 60ns EDO SIMMs).

Hi Chris

>I can only get my hard drive to boot by putting AHDI back on.
>
>What am I doing wrong?

Disable AHDI, Cold boot with the HDdriver master disk in the A: drive, HDD will initialise, now install HDDRIVER.SYS using the relevant menu option, configure to taste, re-boot and get busy.

Formatting a Falc drive could be fatal. Lots of Falc drives are of an older variety
that dont like anything but partitioning.

>Let me know if it works.

He'l let you know if it dont!. 8~)

I thought that's what I was doing - using HDRBOOT to install the boot sector. It certainly said it was making the drive bootable and copying the driver over. But maybe doing it initially with AHDI confused it.

Anyway, I'll try the advice given previously and see what happens.

No I won't.  I won't be able to get on the Internet!

BTW it's not a standard Falcon internal drive - my Falcon is recased
in a lighthouse tower by System Solutions and they put a Maxtor in it
- I don't think it's a standard Falcon one anyway.

I get confused as to whether it's SCSI, IDE etc. ....

Thanks for the advice. It might be a few days before I'm brave enough
to try another reformat! But I'll post the results. If I can get my
machine working again...

>separate them, although they are split across multiple chips.

Yes I thought they wern't independant. I was hoping to leave the
Shifter at the original 32mhz so you can still use a standard Atari

monitor without problems. But I wanted to double the Glue and MMU speed so the Glue was at 16mhz and the MMU at 32mhz. Would this be possible or do they have to be synced together as in a "normal" ST.

> The chipset needs to have control of the bus whenever it thinks it does have it (ie. as in a 8MHz system), and you can not speed up the CPU->ST-memory cycles, so your speeded logic must look to the rest of the board like a normal 8MHz CPU. How you do that is up to you ;-)

So the Shifter can take control of the bus without asking the CPU?
Isn't that like a coprocessor/dualprocessor?

OK so if I can't get Faster RAM access the I can still speed up the TOS can't I. I made a little circuit yesterday that switched the CPU up to 16mhz when not accessing the bus. (like the Mega, but without Cache). It almost worked but my 16mhz signal from the shifter wasn't very good (I'm buying a 16mhz clock soon).

> From a completely asynchronous crystal oscillator. I used a GAL to switch the CPU clock glitch-free to 8MHz when accessing the ST-RAM, and let the CPU run at 36MHz otherwise (including fastram accesses). The logic of the MagnumST ramcard was modified accordingly to run at 36MHz without waitstates (which is possible using normal 60ns EDO SIMMs).

Sounds good. That was one thing I didn't like about the Magnum, the fact that it accessed the RAM at a slow speed. (But then thats not possible on a 8mhz CPU anyway!)
Doesn't matter because you've changed it anyway.

Benchmarks must be quite good for that.

I don't think this will work.

>So the Shifter can take control of the bus without asking the CPU? Isn't that like a coprocessor/dualprocessor?

Yes. Not the shifter alone - it is glue/mmu that take the bus from the CPU and transfer the data to the shifter, which latches the data and then shifts it out. The H/VSYNC is generated by the GLUE.

>OK so if I can't get Faster RAM access the I can still speed up the TOS can't I. I made a little circuit yesterday that switched the CPU up to 16mhz when not accessing the bus. Yes, the c't circuit did that, too. However, when using NVDI, there is not much speed-critical code left in the TOS where you will notice the improvement.

>Benchmarks must be quite good for that.

"real world benchmarks" (like compiling a large program with PureC) showed that it was faster than my PAK-3 setup (with a 36MHz 68030 and cache, but without fastram).

I've just tried to collect my thoughts for doing this, but I've found
I don't have anything called HDDRUTIL.PRG on my HDDRIVER system disk.
The APPs are: HARDBOOT, HCONFIG, HDDRCONF, IDEINIT. The PRGs are
HDDRIVER, CACHEON, CACHEOFF. The ACCs are AUTOPARK, HARDPART,
HCONFIG.

I have v3.51 of HDDRIVER. Could this be the problem?

The only way I could format the disk was with HDX.PRG, on Atari's own
disk, but couldn't partition it using the same program because of some
strange error message. I therefore partitioned it with HARDPART, but
that wouldn't run unless I installed AHDI.

Or something along those lines. Can't remember the exact sequence of
events.

Yes, it will work - in fact I bought my STFM with this mod in pplace.
But it does need a lot of soldering! Also, you may have to fit some
extra resistors and perhaps decoupling caps.

Regards, /Peter/

Chris Simon wrote:
> I have v3.51 of HDDRIVER. Could this be the problem?

Yes. You should upgrade as soon as possible. I once had HDDRIVER 4.6 and found it a bit unreliable (of course the reason was the Falcon hardware but HDDRIVER couldn't handle the problems while e.g. SCSITOOL could). But the most recent version of HDDRIVER (something around 7.8) is very reliable and since I upgraded a month ago I never used any other harddisk driver again.

BTW, don't format a HD regardless what model it is. Let HDDRUTIL mark the bad sectors when you get it. That should be enough.

Gerhard

Hello, I'm searching for the datasheet of the Hitachi HD6301 or Motorola M6800 for an emulation project.

If you have any of them and wish to help me, please reply or mail me

thanks

Yes I'm learning a lot from all this. You obviously know quite a bit
about the STs hardware.

Right then. So I will speed up the CPU and TOS (as I don't own NVDI).
What about speeding the DMA up and the Blitter for STe owners like me.
I'll forget about speeding the chipset up. I'll think about adding
some fastram by using some SRAMs.

>>Benchmarks must be quite good for that.

Sounds like a nice bit of hardware you got there Michael. ;-)

Hi

I'm going to stick a word in for Uwe. I'm very pleased with HDDriver
and I've never used anything else. I recently upgraded to v7.8x just
because of the ATAPI functions. As for reliability, I don't notice a
thing. It just sits on my root drive, boots up and gives me no
problems at all, I forget its there half the time.

Very fast too.

Keep up the good work!

This is possible but you must be careful about it.

I done this to 2 different revision of the motherboard.
One of them worked, while the other didn't.

The one which worked just required the extra DRAM to be soldered on.

The one which failed was not even able to boot-up after the additional DRAM was removed. It turns out that the particular revision needed to have some resistor etc fixed.

Sorry can't tell you more as it was near to 10 years ago since I did them.

Rgds
William

This is your problem, Chris. You should have HDDriver 7.8.

Do not FORMAT your drive; only PARTITION it. Dr Uwe has repeated this
advice several times. Run from floppy HDDriver.Prg, then HDDrUtil.prg
and partition as you desire.

Until you update HDDriver use, from floppy, AHDI and HDX to partition (only).

Contact System Solutions for an upgrade.

Charles.

Several people have said that but unfortunately it's too late now!
I've not heard that advice before anyway. The hard drive is
performing OK now it's been reformatted, it's just that I can't seem to
install HDDRIVER properly.

But if your hard disk gets corrupted (in my case, all the filenames
contained strange characters and I couldn't open anything), what's the
best thing to do? Will doing a Partition solve the problem?

Does any one have an eagle sonic board in their Falcon. I have just
resurected a dead Falcon with this card in it which I got for the princely
sum of $50 aus :-). I am having a few dramas at 32 MHz (dosent always switch
correctly). I was wondering if having
pin 16 floating was causing problem's. Also I need a hard drive bracket 2.5"
for the old bird. Thanks

I think it depends on what language you are writing code.

I've written several networked sequencers and synth
editors in basic and they are ok, but they have
their speed limitations. But they work very nicely
and are indeed rock solid. And talk about the easiest
midi port to program!

Before I get off topic, as far as I know you would need
to at least program in C to get the speed you need.

If you do get to the point of having a working midi engine,
please let me know.

Of course, you could always run Cubase on a 19" monitor with SMPII
and Midex and Logic on another Ste with Steady Eye and Notator on a
3rd and Xor on a 4th...

;-)

Hi to all.
I can�t reach the original question, but by responses I think it was about clock rates inside ST.
If so, given answers are incorrect.

Lyndon Amsdon wrote:

> On 12 Jun 2000 14:27:53 , Michael Schwingen wrote:

I�ve took a look inside a few ST�s after seeing your letter just to be 100% and can tell you
that STs main clock is very slightly above 32 MHz- in mine was 32.0424 MHz quartz.
I have tried 32 MHz in many STs with no noticeable difference in speed, picture position,
sound pitch etc.
Main clock 32.x MHz is no part of any PLL loop and there is no way you can easily divide this into 4.43 MHz.
For that purpose there is second quartz oscilator.
IIRC it is only for serving the needs of TV modulator module for modulating color information into TV signal. Cut the quartz out and TV picture gets B&W-
nothing else happens...

> Thanks for putting me straight.

> >the bus anytime it wants. This only works if the whole stuff is
> >synchronized.

Theoretically, it should work if CPU is faster than original by some nice factor.

While I was toying with it I have noticed DTACK problem.
At the end of the cycle System gives DTACK to the CPU. This should inform CPU that it can finish the cycle and go on. But with higher speed CPU, DTACK stays active
for too long, so if CPU tries anothe r acces immediately afterr first, it will "see" old DTACK

and perform full speed access, even though machine did not recovered from the last.
One tiny cosmetic trick on DTACK should make things much better (have to try it yet...)

In general CPU clk should be constant and switching it up/down could cause many odd things.
It works but not on all machines and not with all CPUs...
I have to try this DTACK thing...

Regards,

Branko

It may work, but you will not get a standard-compliant FBAS signal.

Right. The PLL will run on, even without the 4.433MHz reference.

If you don�t believe me, look it up in the schematic.

It may be that there were STs with a fixed crystal oscillator instead of the
VCXO/PLL for versions without FBAS output. IIRC, the schematic had both
options.

The PLL works by syncing the HSYNC to the 4.433MHz PAL clock. HSYNC is
deviced from the 32.xxxMHz main logic clock, and that is adjusted so that
the HSYNC phase is OK.

I am not sure about NTSC machines, but I think they used the same mechanism
(with a 3.*MHz reference instead of 4.433MHz).

>Theoretically, it should work if CPU is faster than original by some nice factor.

Only if the glue logic gets the bus whenever it needs to to do video
accesses.

You can speed up the whole machine by increasing the 32.xMHz clock (and
this will of course modify the video timing accordingly). Running the CPU
asynchronous requires logic to re-synchronize the CPU signals to the
system�s 8MHz clock.

>While I was toying with it I have noticed DTACK problem.

No wonder: the DTACK timing is relative to the clock. Now if the system and
the CPU use different clocks, you will get such problems.

It is not just DTACK: you will probably get similar problems with AS and the
whole bus arbitration stuff.

>In general CPU clk should be constant and switching it up/down could cause many
>odd things.

switching the CPU clock of a 68000 is absolutely no problem as long as you
satisfy the minimum clock high/low times from the data sheet. This means
that you may *not* simply switch between two asynchronous clocks (say with a
2:1 multiplexer), since this will produce glitches which confuse the CPU.

The modified MagnumST works absolutely stable by switching the CPU between
8MHz and 36MHz (and by doing this glitch-free - you can use *any*
asynchronous signal in that circuit instead of 36MHz, as long as the CPU
still runs at that clock. My 68HC000-16 works up to 36MHz).

I made this circuit, and yes it is a bit glitchy.

What were the schematics that didn't make it glitchy? Could you send them to me please.

Maybe we did not undesrtand each other fully.
If you are implying that 4.43 MHz oscillator runs within some kind of PLL loop, it
may
be so,
but in very limited sense. It could be pulled in very narrow frequency band
(through
some
capacitive influence on the quartz) and that might be also teoretically true with
32.x
MHz quarz,
but this would be marginal, besides that how does one synchronize clocks that are
so
different ?
They have no simple common denominators and certainly no IC to do the phase
comparison, frequency

division and to pump one ocillator with regards to the other.
It may well be that PLL is contained inside RF modulator, but this is optional
(many
STs are without it)

Are you sure about that ? If that would be true colors on the TV screen would
freak
out when one would use
quartz oscillator instead of quartz. I did that and everything worked just fine.
4.434 Mhz is bursted in the video signal somewhere during HSYNC time so that
receiving
end (TV) can synchronise
its oscilator to computers one before the scan line starts....

I did that and it ran fine with minor tweaks on 48 MHz. At that time, I did not
have
sufficient data
about STs guts to try to do something about the picture, since SM124 couldn�t keep
up.

Nowadays it would be trivial to hook up some cool 17" Hansol and let it fly in B&W
mode...

In more normal systems, one could trigger DTACK without concerns about CLK.
Motorola meant for it to be used like that anyway. Whenever you get fed up, just
assert
DTACK and it will be recognised at next rising clock edge.
Trouble is that logic that generates DTACK does this with regards to the 8 MHz
clock
and that is not cool. When DTACK is generated CPU should get off the bus in the
next
CLK or so
and DTACK should be deasserted at the moment that AS, LDS and UDS go inactive, but
that does not happen.

>
> It is not just DTACK: you will probably get similar problems with AS and the
> whole bus arbitration stuff.
>

Not true. I did a TOS 2.06 & IDE adapter for the ST a while ago and just for the
kicks

adapted turbo modification so that CPU would work at 16MHz also when executing
the code from TOS and speed difference was very obvious. It was a minor hack but
people that saw it working on my machine wanted to have it....
Later version had turboswitch that enabled me to hit the pedal-to-the-metal
while running some benchmark to see the difference.
It took me several tries to get to the version that enabled manual switch
reliably...

Not quite. Well, maybe on some "modern" 68HC000 or 68EC000 CPU.
Old 68000 is machine with dynamic registers that demand internal refreshing and contains quite some analog stuff inside...
This means that they must be fed proper clock signal which must be stable during operation.
Modern EC etc... variants contain standard gates (because they are available also as a core from standard gates if you pay big $$$) and no voodo magic.

For one thing, while speeding up ST, I have noticed that best versions for that were
10 MHz versions.
Majority of 8 MHz versions did not work reliably and that goes also for several pieces
of 12.5 MHz
that I tried. I�m talking about NMOS 68000 as found inside ST.

Maybe because of 68HCxxx instead of ordinary 68xxx.

Unlikely. What have you installed in your computer that could have caused this corruption? Video card?

Hi Chris

>Thanks for the advice. It might be a few days before I'm brave enough
>to try another reformat! But I'll post the results. If I can get my
>machine working again...

You really need some advise that doesnt involve re-formatting drives, it bad for their health, use it as a last resort only.

Nothing unless you wrote the client. And even then it's not 'wrong'.

What is happening is that the news server is closing the connection. It's possible it's timing out. or ptentially doesn't like some message that the client sent it. hard to tell without more details.

However they did a normal close on the connection.

You are not doing anything wrong. The newsserver connection timed out, so before leaving the text editor (if you are in a multitasking environment)go to newsie and click on "connect to server". After that you can post, unless the modem connection is dropped (happens for long periods of inactivity through the connection).

Salu2

Daniel.

None unfortunatly, I think the ST's lpt port is only single directional. The
Falcon and TT should be able to run them in theory, but no drivers. Its very
slow anyway. I could be wrong but I think that the new 250MB drives come
with both Parallel and SCSI built in?

No, it's not a question of being directionnal or bi-directionnal. All Ataris have a bi-directionnal printer port. The problem is missing lines on the connector.

Details are in the Quick FAQ.

"Hallvard Tangeraas" <halln@c2i.net> wrote in message news:1eb7lgn.13qodztjc15ruN%halln@c2i.net...

: Not really an Atari ST specific question, but someone might be
: able to help anyway since I hear that RGB monitors have been
: used on Atari STs.
:
: A friend of mine with a Roland S-760 sampler need to connect a
: monitor to it, and the sampler only outputs S-video and
: digital-RGB.
: I've found a monitor for him which the seller says is an RGB,
: but I don't know if it's the same as "Digital RGB", if there's
: only one type of RGB or what.
:
: Anyway, these are the specs:
:
:
: Phillips CM8833-II
: ------------------
: Screensize: 14"
: Input Connector: 9-pin D, CVBS
: Video Input: Analogue RGB & TTL
: Horiz Scan Rate: 15.625Khz
: Vert Scan Rate: 47-62.5Hz
: Pixel Res: 640x256
: Dot Pitch: .42
:
: So, is this monitor suitable for something that outputs
: digital RGB?

If not, it would be quite simple to make it accept "digital RGB", a couple of resistors and a transistor in the connector housing will do the trick for you. Do you have more info on the video source? It appears that the Roland has a CGA?

The monitor you're mentioning is very versatile and can be used for almost any computer of the 8 and 16 bit era. It's also excellent as a second TV in the house, you just need to hook it to a video thru the CVBS and AUDIO lines.

Hi

There was a disscussion a couple of weeks back about accelerating the system bus on a ST to 10 maybe 12mhz.. I have a spare STe to play around on so I might attempt this project. Maybe put a 32k cache on the cpu as well.
These are the chips on the STe.

ACIA	500khz (these will have to be kept at 500khz)
Cpu	8mhz this can take 12 but you can get 20 mhz versions
DMA	increasing this should improve hard disk speed and ste sound
Yamaha	not sure, faster printing?

Will increasing the yamaha or DMA cause sound files to be played at the wrong speed?

MC68901	don't change
WD1772	keep at 8 or 16 (DD or HD mode)

MMU,blitter,glue
Glue will need to be increased. Blitter probably can take 12mhz. MMU could be increased. Problem here is these are in one package and you can't control the individual speeds of these. On standard STe MMU and Blitter work at have the speed of the glue. Glue at 16mhz, mmu and blitter are at 8mhz.

Shifter will be the big dificulty. I think it was said that the freq on low res is about 15khz. So increasing the shifter will make it possible to connect to a PC monitor. I'm not sure on this part so I'll need some help.

What is the extra chip next to the CPU fitted in some STes(large 68pin plcc like cpu). I have one ste with the chip and the other without it. Looking at the schematics shows it. It doesn't make any performance difference. So why have it?

```

:
: Almost makes me want to have one myself :-)
: Would be nice for video editing etc.

I've connected the following to that monitor: C64, Atari ST,
Falcon 030, Amiga, VCR. I bet that a CGA would work, with that
special cable, as well.

I'll come back to you with the schematic.

news:siv16ggk5pj120@corp.supernews.com...

: Hi
:
: There was a disscussion a couple of weeks back about
accelerating the
: system bus on a ST to 10 maybe 12mhz.. I have a spare STe to
play
: around on so I might attempt this project. Maybe put a 32k
cache on
: the cpu as well.
: These are the chips on the STe.
:
: ACIA   500khz (these will have to be kept at 500khz)
: Cpu   8mhz this can take 12 but you can get 20 mhz
versions
: DMA   increasing this should improve hard disk speed and
ste sound
: Yamaha   not sure, faster printing?
: Will increasing the yamaha or DMA cause sound files to be
played at
: the wrong speed?
: MC68901   don't change
: WD1772   keep at 8 or 16 (DD or HD mode)

You shouldn't change the frequency of the Yamaha sound chip

(2MHz), all sounds will be wrong (too high and too short). You can start out by providing a new frequency source for all the chips mentioned above. An oscillator of 32MHz coupled to a 4024 or 4040 which will output:

32MHz
32/2=16MHz
32/4=8MHz
32/8=4MHz
32/16=2MHz
32/32=1MHz
32/64=0.5MHz

: MMU,blitter,glue
: Glue will need to be increased. Blitter probably can take 12mhz. MMU
: could be increased. Problem here is these are in one package and you
: can't control the individual speeds of these. On standard STe MMU and
: Blitter work at have the speed of the glue. Glue at 16mhz, mmu and
: blitter are at 8mhz.
:
: Shifter will be the big dificulty. I think it was said that the freq
: on low res is about 15khz. So increasing the shifter will make it
: possible to connect to a PC monitor. I'm not sure on this part so
: I'll need some help.

Your display will be warped, distorted, scrambled. You shouldn't use the SM124 monitor with an accelerated Shifter, you'll kill it. Same applies to color monitors. Use a good modern multisync SVGA monitor.

You could come around this by using a separate graphics card, like the Panther. For experimental purposes you should consider directing your output to a serial console (another ST and a nullmodem) instead of to the screen.

: What is the extra chip next to the CPU fitted in some Tes(large
: 68pin plcc like cpu). I have one ste with the chip and the other
: without it. Looking at the schematics shows it. It doesn't make
: any performance difference. So why have it?

Some STe:s have a separate Blitter chip, some have an integrated. Those with separate normally have the 68p plcc, just

the same package as the MC68000, and are situated slightly to
the "northwest" of it. The Blitter is known to cause trouble in
this respect. Best is to remove it.

Also take a look at the rating of your RAM chips, if they're
150ns you better exchange them. Try finding SIMMs that are 70ns
instead.

>You shouldn't change the frequency of the Yamaha sound chip
>(2MHz), all sounds will be wrong (too high and too short).
Yeah thought so. DMA acceleration won't harm the sound will it
because all that does is shift blocks of memory to the DACs.

>You
>can start out by providing a new frequency source for all the
>chips mentioned above. An oscillator of 32MHz coupled to a 4024

>32/4=8MHz
>32/8=4MHz
>32/16=2MHz
>32/32=1MHz
>32/64=0.5MHz
You reckon that the selected chips can take twice there normal freq?
I would use the 74HT** alternative to the 4040 cos it will be more
stable at 32mhz, but you've got the idea. I was thinking of running
those chips at a third higher freq. Cpu@12mhz Glue@24Mhz etc
Everything on the ST is access asycronous I think because of the way

the CPU works with the DTACK pin.

>Your display will be warped, distorted, scrambled. You shouldn't

Maybe I could select the freq applied to the shifter so you don't have
to have extended video modes if you want.

>You could come around this by using a separate graphics card,
>like the Panther.

People don't want to spend �200 for a a graphics card when you can get
a Falcon with the 030 for a bit more if you hunt around.

>Some STe:s have a separate Blitter chip, some have an

Northwest looking from where? Mine is to the left and down a bit from
the cpu, looking from the front. If it is an external blitter it's
never caused me any hassle. It's chip number begins with a S, can't
remember all of it. It does say Atari on it though.

>Also take a look at the rating of your RAM chips, if they're
>150ns you better exchange them. Try finding SIMMs that are 70ns
>instead.

Most PC 486 simms will be for 16Mhz

This should really speed the ST up a bit. No accelerators for the ST
have sped up the bus before have they? The DMA acceleration should
improve the sound by miles.

: Hi folks,
:
: Does anyone have or know if there is a device that lets one
you two sets of TOS ROMs.

You can do this in several ways. The simplest is to burn your twin TOS:es into double capacity EPROM:s and toggle the highest address line by hand switching. When the highest address bit is low, the TOS in the lower half of the chips will be active. When high, the upper TOS will activate. Beside the EPROM:s (2*27C020) you will only need an SMTP and some wire.

You can also piggy-back the chips but this requires quite a lot more work.

Are there any obstacles to letting two Ataris share the same
SCSI bus? One harddisk, two computers with simultaneous access
to it. How about sharing the SCSI bus with other systems, PC,
Mac etc.?

This could function as some kind of a network?

The STs port is the bare minimum of connections to make a printer work. It was great that the ST had a normal (ish) printer port at the time but it doesn't match a normal PC printer port for control lines. The fact it is single directional isn't the problem as Zip drives work with old PC single directional ports I believe. However a PCs EPP port is capable of upto 1MEG a second and ECP even more with DMA access.

Some parallel devices are actually SCSI or IDE internally with a little adaptor board added so you can link it to a parallel port but the majority are built for parallel from the ground up.

I have a commercial TOS switcher here on the shelf. I found it inside a blown ST that came in to me. The STE was fitted with this and an IDE interface with a 2.5" HD and labelled as an 4160STE. I presume the add-ons made the distinction. I am unsure whether one of these might have caused the blow, I needed other parts that came with it so I did not look further... just removed the clever bits and disposed of the motherboard... which was stone dead.
The PSU survived, as did the Floppy, and the above mentioned, as well as the case top and the third pary mono monitor and adaptor and mouse.

The Rom switcher is a TUS developments from Cheshire, here in the UK. I very much doubt if they exist any more.

It's basically as the man said, its a dual socket mounted on a pcb with thru connectors to the sockets on the motherboard. There is one bank (3 pins) of jumpers and a flying lead with a small switch.
Its fitted with ROMS marked TOS 1.62/2.06 (C)Atari UK Mftr COMPO UK and marked ROM HI and ROM LO.

It sounds like an interested project that you are undertaking. Just a note on the above: when I was working on a 16 MHz CPU accelerator with cache for the STFM (which is finished and sitting on a shelf), I found that not everything is accessed asynchronous. The RAM in particular has a synchronous bus cycle, and of course the 6800 peripherals require special synchronous handling. I also found that the DMA chip is exceedingly sensitive to the bus timing, although I cannot remember the details.

That's impossible due to the lack of a PC compatible parallel port.
But there is an ROM port adapter for parallel ZIPs from Woller available.

Unlikely that would have caused it. More likely to be the heat inside
the case from the extra ram, hard drive etc reduced one of the chips
life time. My STe had a IDE interface from TUS (very good) and I
managed to squeze a 3.5" 1.7Gb harddrive in between the PSU and Floppy
using half height Simms, boy did that get hot. I had to set it up so
the HD would park every 2 minutes!

>The Rom switcher is a TUS developments from Cheshire, here in the UK. I very

I'm not sur if TUS still make ST stuff any more. There last advert
was in AC15 back in November. I rang up in Febuary wanting a High
speed Serial Port but they don't sell them any more, trouble with
getting the parts or something.

>It's basically as the man said, its a dual socket mounted on a pcb with thru

The switch is for TOS 1.62 or 2.06. The jumper is selected to
correspond to which EPROMs you had before 28 pin or 32.

I didn't know that!

>The RAM in particular has a synchronous bus cycle,

The RAM should be fine shouldn't it because if I speed it up
proportional to the CPU it should be alright.

	CPU	RAM
Old	8mhz	8mhz
New	16mhz	16mhz

>and of course the 6800 peripherals require special
>synchronous handling.

Thats just the Midi and Keyboard controller right? How would you get
around this? It would ruin the performance slowing the ST back down
to normal speed for keyboard and midi access.

>I also found that the DMA chip is exceedingly
>sensitive to the bus timing, although I cannot remember the details.

Oh. What it requires a good clean clock signal or do you mean it can't
take more than 8mhz. I was hoping this would be quite a good chip to
accelerate.
Thanks for the help

Hi Martin

>Are there any obstacles to letting two Ataris share the same
>SCSI bus? One harddisk, two computers with simultaneous access
>to it. How about sharing the SCSI bus with other systems, PC,
>Mac etc.?

As far as i'm aware this is only possible with a Link96 and HDdriver, which
translates
to a MegaSTE basesd system as this is a machine specific device, even then the
puters
would have to be accessing non-simultaneous data.

>This could function as some kind of a network?

A SCSI network, nice.

--

        Regards from STEve & his nice warm cosey PAK'd MegaSTE.

I would be interested in hearing from people with non-British keyboards what value their _AKP cookie reports. Even more useful would be reports from people whose keyboard and TOS are of different nationalities. Please give the machine and TOS version in each case.

The cookie value may be established from the COOKIES.CPX by Dieter Fiebelkorn, or one of the system testers mentioned below.

The reason for the enquiry is the discrepancies between Mark Baines's PROFILE2.PRG as compared to other similar testers on the keyboard nationality of my British Falcon. This reports:

```
     Keyboard nationality and language:   United Kingdom and English
```

and in the cookies list:

```
     _AKP    $00000003             3
```

All the other testers give the same cookie value, but interpret the keyboard and/or TOS nationality as USA.

```
Thus in Christophe Boyanique's Sha'uri, in Cookies listing:
                                       -------
     _AKP $5F414B50 ($00000003)
    Keyboard language: USA
    TOS language:      UK
```

But it also reports in Non-Volatile RAM listing:

```
     TOS language:          USA
      Keyboard language:     UK
```

```
Sysinfo2 by David Troy from Toad computers reports:
--------
     TOS Country:        USA
```

and in the Cookies list again:

```
     0x5f414b50 (_AKP)    0x00000003
```

```
SysInfo V4.80b by Thorsten Bergner reports in System:
-------
     Country      : GBR
```

and in Non-Volatile Memory

```
     Keyboard     : GBR
     Language     : GBR
```

but in Cookie list:
_AKP 3 Keyb. : USA / Country : GBR

Now the 'Atari Compendium' states for the _AKP cookie:
'...The high word of this cookie is currently reserved. The low word indicates the language currently used by TOS for keyboard interpretation and alerts. See the explanation for the country code in the OS header earlier in this chapter for valid values.'

That section lists the os_conf and countries (0 = USA ... 3 =UK ...) and adds 'As of TOS 4.0 the OS is compiled with text for all languages and switches between them based on the country code stored in non-volatile RAM. Use the _AKP cookie to determine the actual language in use.'

There seems to be nothing explicit there about using different parts of the value for keyboard and TOS nationality.

On the other hand Zorro's TOS.HYP states, in translation:

_AKP	Keyboard layout and national language The Cookie gives info about the language and the keyboard layout of the system. Bits 0-7 inform about the language:

0 = USA
...
3 = England
...

Bits 8-15 identify the layout of the keyboard

followed by the same table.

Sha'uri too uses a similar explanation of the cookie:

_AKP	Advanced Keyboard Processor high word reserved very low word: keyboard low word: TOS language

and may have got it from the same source.

It is possible, I guess, that the above applies to pre-TOS 4.xx machines. I am told by a German user that his machine returns $00000101 but I am not sure which TOS he is running.

Thanks for your help!

Regards, /Peter/

Hi all,

I have the following setup:

MegaST
MegaFile 30

When I switch the crates on (Megafile first) I get a white screen
until I insert a disk, then the TOS window comes up with two
drives (A&B).
The harddisk is not accessible.
What steps do I have to take to install the harddisk under TOS?
What programs do I need for low level format, partitioning, high
level format?

TIA, Robert

No, a LINK97 is required. The LINK96 will block the bus so that no other device except the ST the LINK96 is connected to can access other devices. As far as I know this is the main difference between LINK96 and LINK97. In this case it's crucial.

> Mac etc.?

You can share the bus as long as you can guarantee that you don't get inconsistencies in your data on the shared partitions. Note that one computer is not able to see whether the other has changed data on the drive. So you have to be very careful here. You have to ensure that you flush the GEMDOS cache of the Atari (by pressing Shift-Esc on most modern desktops) after you have written data to a partition that is to be read or written to by the Atari. The same would have to be done after writing data to a partition with the Atari, before accessing this partition again by the PC or Mac. I don't know if you can easily flush the drive caches of the PC or Mac. I doubt you can. Also note that Shift-Esc only flushes the GEMDOS cache of the Atari. So if you have a FAT32 or EXT2FS this won't help.

> This could function as some kind of a network?

A real network is much more powerful and you don't have any of the problems mentioned above. For TT and Falcon SCSI HDDRIVER supports the SCSI target interface which provides the basis for such a network on a TCP/IP basis, preferably under MiNT. But so far nobody has started to write a network driver for SCSI so there is still not TCP/IP over SCSI.

>
I've done this for an STFM, it should also work for the STE, but I've never looked at the schematics. There was an article in one of the German computer

magazines explaining "how to" (for an old STM, as it was a long time ago).

The article had a new master oscillator (48 Mhz), which divided down to 24 for the MMU & 12 for the Glue/CPU.

You also had 2 & 0.5 MHz for the Yamaha & 6850's (keyboard & MIDI).
>
>>Your display will be warped, distorted, scrambled. You shouldn't
>>use the SM124 monitor with an accelerated Shifter, you'll kill
>>it. Same applies to color monitors. Use a good modern multisync
>>SVGA monitor.

Yes, very good advice, my SM125 was not able to display the picture correctly, so I stopped doing this. The new video frequencies will be 1/3 higher than before. The article showed you how to correct this & get the frequencies back to normal values, or even "overscanned" screen resolutions.

Unfortunately, the STE shifter is difficult to modify, as some signals are internal & cannot be modified the way the old STFM Shifter/Glue could.

>>For experimental purposes you should consider
>>directing your output to a serial console (another ST and a
>>nullmodem) instead of to the screen.

Another good idea, you should see approx 50% increase in processing speed, i.e a Gembench session would show everything 50% faster.
Of course, you can't run Gembench on serial ouput, so you might have to try a few other speed checker utilities. I think you are guaranteed a 50% increase.

>Maybe I could select the freq applied to the shifter so you don't have
>to have extended video modes if you want.
>
I don't think so. I think the shifter must be sync'ed to the rest of the bus devices. The ST is async, in that you can change the master clock; but you can't change parts of the divider chain frequencies, they all must be locked to the master clock. The FD controller, MFP, Yamaha & 6850's can be clocked seperately, but the CPU/Glue/Shifter must be locked.

>

I don't have a blitter, but I guess you could disable it.
Perhaps it might run @ 12 MHz, it should be able to.
>
>>Also take a look at the rating of your RAM chips, if they're
>>150ns you better exchange them. Try finding SIMMs that are 70ns
>>instead.
>Most PC 486 simms will be for 16Mhz

Yes, the onboard RAM is probably too slow. SIMMS will be just right for the faster bus.

>
>This should really speed the ST up a bit. No accelerators for the ST
>have sped up the bus before have they? The DMA acceleration should
>improve the sound by miles.

Not having a STE, I can't comment on the DMA for sound, but disk transfers will be faster. You are correct about the accelerators, most provide a faster CPU, with perhaps a bank of fast memory & maybe an expansion port.

I intend to revisit this idea later in the year, but I will be trying for a 16 MHz mainboard frequency. This would give a X2 increase.
Also, by changing the CPU for a faster version & overclocking it (driven from the 32 MHz clock during internal operations), another (average) 50% increase in certain operations will be got.

Good luck, & be careful with the modifications.

Sorry, that's not 100% true. I don't know to which desktop you refer but
if you use Thing (default desktop under MiNT/N.AES) the caches are
definitly flushed. I expect the same for Jinnee.

Tschuess

That's fine, so at least flushing the caches is no problem for the
Atari.

You must wait a few seconds for the Megafile to speed up, then switch on the MegaST.

Is the Megafile spinning? Does the light come on?

> The harddisk is not accessible.

No, you would have to run AHDI for the ST to see the drive.

> What steps do I have to take to install the harddisk under TOS?
> What programs do I need for low level format, partitioning, high
> level format?

You shouldn't need to low-level format it. High level formatting is partionning, same thing.

You should get AHDI from http://bales.online.fr/atari/files

Run AHDI.PRG from floppy, then create the C icon on the desktop. If this doesn't work, then the drive is probably dead. Check out the error messages.

If it does work, use HINSTALL to install a bootable boot sector and the SHDRIVER.SYS file on the disk(SHDRIVER.SYS is actually AHDI.PRG with a different name).

```

Yes, the same problem why you can overscan a STe.

>I think the shifter must be sync'ed to the rest of the bus
>devices. The ST is async, in that you can change the master clock; but you
>can't change parts of the divider chain frequencies, they all must be locked
>to the master clock. The FD controller, MFP, Yamaha & 6850's can be clocked
>seperately, but the CPU/Glue/Shifter must be locked.

Async means that <this is what i thought> the CPU sends an address out
on the bus and waits for anything to respond. The device in the
correct address range asks for the 8/16 bits of data (checks the
control lines ,R/W etc) it then does what it needs to do. It could take
10 minutes doing its thing while the CPU is just sitting there. When
the device has finished it asserts DTACK that kicks the CPU back to
life to tell it "I have finished my job now wake up!". There is a doc
to put a 68881 co-processor in an ST. If you had a 68881FN32 you
could clock it to 32+Mhz and it would work.

>Not having a STE,

You don't know what you're missing.

>I can't comment on the DMA for sound, but disk transfers
>will be faster. You are correct about the accelerators, most provide a faster

>MHz mainboard frequency. This would give a X2 increase.
>Also, by changing the CPU for a faster version & overclocking it (driven from
>the 32 MHz clock during internal operations), another (average) 50% increase
>in certain operations will be got.

I think you're underestimating the extra power it can provide. A
16mhz CPU and 32k cache will give approx 160% increase in speed.
The highest speed 68000 was 20mhz 68EC000FN20. It should be safe to
clock it to 32mhz though. PLCC only package.

>Good luck, & be careful with the modifications.

I will thanks! ;-)

Yes, it is however in German. I've only partly translated it. Just enough to
get the idea of what's going on. I don't have the full article, the section on
getting new video resolutions is incomplete/unreadable.

Perhaps somebody else could supply this part.

>>the MMU & 12 for the Glue/CPU.
>Isn't the glue in normal ST run twice the speed of the CPU and MMU?

I think the STFM Glue runs @ 8 MHz, the MMU @ 16 MHz, the Shifter @ 32 MHz.
The main STFM clock is a PLL,locked to the 4.433 MHz PAL sub carrier.
It should be possible to change the crystal, or add in a new oscillator if you
don't care about lines onthe TV.
>

>

You are essentially correct, however, I found that the ST did not like the CPU running at odd multiples of the bus with my overclocking circuit. I tried the CPU @ 24 MHz while the bus was still @ 8 MHz, it did not work.

I was not using any buffering chips, I just switched the AS line depending on whether the CPU was accessing the bus or not. Perhaps this method is to simple, but it has worked for over 5 years now (bus @ 8 MHz, CPU switches between 8/16 MHz).

>>Not having a STE,

Perhaps, but I had not planned on a cache, I was just going to speedup the bus, then overclock the CPU, or change the device to a faster part, then overclock that part. If the internal operations are running at 16 MHz, then intensive calculations are much faster e.g,MUL & DIV instructions take 144 clock cycles. At 16 MHz, the time is almost halved (there is some time lost due to the switchover from 8 to 16 MHz), I got increases of 95% for these instructions. A cache module would be nice, but I never got around to adding one because my circuit was so simple, just 6 wires to solder & one pin to cut.

What I would like to add would be a circuit to access the ROM at the same speed as the processor is running at.

>The highest speed 68000 was 20mhz 68EC000FN20. It should be safe to
>clock it to 32mhz though. PLCC only package.

Well, there were 20 MHz DIP versions made by SGS Thomson.
I think there was a 68HC000 version also.

Somebody posted in this groups (a long time ago now) that they had overclocked some 68000's to 64 MHz & they worked. Now that's a fast machine,even if the bus is still running @ 8 MHz.
>

Which magazine was it in? What issue? I haven't seen any ST
accelerater that "upped" the bus speed.

>I think the STFM Glue runs @ 8 MHz, the MMU @ 16 MHz, the Shifter @ 32 MHz.
>The main STFM clock is a PLL,locked to the 4.433 MHz PAL sub carrier.
>It should be possible to change the crystal, or add in a new oscillator if you
>don't care about lines onthe TV.
Yes you're probably right. I was thinking off the top of me head.
The *main* clock is 32mhz quartz clock. The 4.433 is the clock to
provide a signal for the TV signal. This is different for 50/60hz TV
machines. Pal is 4.433   NTSC is 3.579.

>>Async means that <this is what i thought> the CPU sends an address out

What processor speed was it? If it was 8 it might be unstable at
24mhz. So what happened when it was driving at 24mhz? Just crashing
or nothing at all?

>I was not using any buffering chips, I just switched the AS line depending on
>whether the CPU was accessing the bus or not. Perhaps this method is to
>simple, but it has worked for over 5 years now (bus @ 8 MHz, CPU switches
>between 8/16 MHz).
So having a 16mhz accelerator like yours isn't as good as it sounds
(not saying its rubbish) because every time the cpu needs to access
other chips it has to switch done to 8mhz mode. Would it be possible
with a few GAL chips (or normal logic) power the CPU at 16/24 mhz when
not accesing the bus, but then when it access's the bus it drives the
CPU at different speeds for the different chips its acccesing.

>>>I can't comment on the DMA for sound, but disk transfers

>>
>Is there any chance an accelerated STE might be able to handle MP3's?
>Aybody know the answer to this?
I have tried playing back an MP3 off a PC CD using Aniplayer. The
machine just crashed. Same with movies though. It does say its not
really designed for STs. Anyone know of a MP3 player for STe? I would
be supprised to see a MP3 playing on a STFM.

>>I think you're underestimating the extra power it can provide. A

Yes we'll keep it without cache at the moment. Keep it simple for the
time being.

>If the internal operations are running at 16 MHz, then
>intensive calculations are much faster e.g,MUL & DIV instructions take 144
>clock cycles.
144! Quite a long way off RISC technology!

>Just 6 wires to solder & one pin to cut.
Is that the one with two logic chips a 7474 and 7400?

>What I would like to add would be a circuit to access the ROM at the same

>speed as the processor is running at.
What I mentioned before on this post, about accesing chips at differnet speeds.

>Well, there were 20 MHz DIP versions made by SGS Thomson.
>I think there was a 68HC000 version also.
Motorola have stopped selling the 68000. Not sure about SGS Thomson though.

>Somebody posted in this groups (a long time ago now) that they had overclocked
>some 68000's to 64 MHz & they worked. Now that's a fast machine,even if the
>bus is still running @ 8 MHz.
Hmm. Motorola never AFAIK made a 68000 more than 20 or 24mhz. The T28 clocked the CPU to 28mhz and T36 to 36mhz although I have never heard of a T36 being used. Might have been too unstable. With it @64mhz you would need a heatsink and fan.

This should work out to be pretty nice. Not bad going from a 15 year old. Bet no one new that!

(these posts are starting to get a bit too long, opps)

Can anyone help?

The Warp9 handbook says that, if on subsequent re-boots, the WARP9CNF.PRG is run after the set-up has been saved to a WARP9.CNF file by the Warp9 control panel, the configuration will be read and acted upon.

Well, when WARP9CNF.PRG is run on my Atari, it reports via a message on the screen that the configuration file HAS been read, but the mouse "block" effect set in the CFG file is not effected. If the control panel accessory is re-installed, then the configuration file is read and acted upon correctly. But I don't want to waste an accessory slot...

Have I got a corrupted WARP9CNF.PRG (512 bytes), or was this a recognised problem when Warp9 was being supported?

The Warp9 version is 3.80, and is used on a TOS 1.62 4-megabyte STE.

pid 129 (newsie) bus error user pc=ffff001c address:69b190 (basepage=66ac60)

I have received the same with latest beta kernal of mint.I am now using mint 1.15.1 (falcon 030).

I connect with pppd 2.20.

If you are using mintnet, give aMail a try and or/pine.  Newsie does
alot but pine is much nicer for news.

That's wrong. You can easily share a drive with the PC as long as the drive has a DOS or Windows compatible partition layout. I've done so with PCs/Ataris and Macs/Ataris and other users have done so too. The drive format is the same for any platform anyway since formatting is an atomic operation completely done by the hard disk drive, not by the operating system. The only thing that depends on the platform is the filesystem layout. Creating filesystems under Windows is sometimes referred to as "formatting", which might cause some confusion.

Hi Folks,

just got my hands on an STe which 9 years after it was launched is still new to me!

I am going to add some more RAM as I have a stack of 1 Mb 30 Pin SIMMS and was wondering if it was sensitive to the spec of the SIMM (3, 8 or 9 Chip) 70, 80 or 100 ns?

Any help you can render will be of great help

Julian

No, it's ok. Just try not to mix them and at least keep them in pairs (slots
1 and 3, and 2 and 4).

Hi Julian
The simms you have are all fast enough, in the ST they have to be
125ns or faster. The STe seems to work fine with any type of 1 mb
simm. Just try to fing 4 of the same. The simms are inserted at an
angle then tilted back.

Planning on releasing that? Plenty of ST owners would like a speed increase,
and there aren't that many accelerators for sale these days...

Mario Becroft's forthcoming SCSI ethernet hardware would presumably need a network driver?

Yes, this is correct. For any kind of non-standard hardware a driver is required. The usual drivers (e. g. for CD ROM drives or hard disks) can only be used for standard hardware connected to the standardized ports.

If anyone is interested in purchasing a Falcon w 32 megs of ram and a CII board installed that just doesn't work since the CII board was installed, please email me.

I will respond to the highest offer.

Thanks fellow atarians for everything

but this was the very last straw. Im now on a 550mhz PIII 128 megs of ram. What a killer system!

Hi!

Just wondering what happened to the Panther Graphics card which System Solutions were selling. I've been waiting since the article in Atari World 1995 to see one. It fitted in a standard ST case and came with 1-2Mb of memory. It was equipped with the ET4000 chipset. Has anyone had any experience driving an ET4000 (either with Panther or the ISA graphics card adaptor) NVDI supports these cards. What are the graphics like and how compatible is it with software?

> had any experience driving an ET4000 (either with Panther or the ISA

The Panther *is* an ISA-adapter. The current version is Panther II, which
has two slots and can drive both a graphics-card (ET4000) and
ethernet-card at the same time.

> graphics card adaptor) NVDI supports these cards. What are the
> graphics like and how compatible is it with software?

I'd guess it's just as compatible as my Nova, which is 99% compatible with
decently written software. Stuff that write directly to the screen
(i.e. most midi-software, trackers, demos, games etc) won't work.

For adding more serial ports, there might also be the possibility of locating the board that Dave Small produced that added four serial ports to a MegaST. (I'd guess it might even work on an STE but I'm not sure of that.) It did not require you to have an SST first as I recall. I think some Atarians were using it for their bbs's.

At this point in time 250.00 is the highest bid in payments.

It will be sold tomorrow if no one can offer 300.00 or more up front. I have agreed with the bidder that if someone offered
700.00 in payments it would be the former bidders at 250.00 in payments since he played no games in offering the asking price.

Thank you

Gene Pineda

http://www.wrs-online.de/ ! Be forewarned; their English pages aren't very high in number.. you can get a general idea of things by running whatever page you want to read through Altavista's Babelfish Translation Engine (http://babelfish.altavista.com/).

Another warning: spoken language is full of ambiguity, which computers (as black-and-white logic machines) aren't well-suited to handle.
Don't expect too much. ;-)

Derek

- 4MB FALCON 030 WITH 4MB RAM AND 80M INTERNAL HD
- MOUSE, WITH LITTLE STYROFOAM PIECE STILL UNDER THE BALL
- ST VIDEO ADAPTER IN PACKAGE (I BOUGHT THIS AFTER I BOUGHT THE FALCON TO TEST IT ONCE WITH MY SC1224)
- VGA VIDEO ADAPTER NEW IN PACKAGE.
- A "READ ME FIRST" PLASTIC LIKE SHEET THAT SHOWS HOW TO CONNECT MONITOR TO THE FALCON WITH DIAGRAMS. (AS LONG AS THE BOX ITSELF)
- CALENDERS AND APPOINTMENTS MANUAL WITH DISK AND WHAT SEEMS LIKE A LITTLE INSTRUCTION SHEET FOR BREAKOUT??? SEALED IN PLASTIC ..NEVER OPENED
- ATARI MULTI TOS HARDDRIVE DISK WITH MANUAL IN SEALED PLASTIC ...NEVER OPENED
- ATARI SPEEDO GDOS SEALED NEVER OPENED WITH 2 DISKS
- ATARI WORKS WITH QUICK REFERENCE CARD AND MANUAL WITH 2 DISKS NEVER OPENED
- ATARI FALCON D2D RECORDER MANUAL IN PLASTIC...I OPENED TO READ ABOUT ITS DIGITAL RECORDING CAPABILITIES......MINT LIKE IT WAS NEVER READ
- LASTLY FOR MANUALS...THE FALCON030 MANUAL WITH LANGUAGE DISK AND ATARI EXTRA PROGRAMS DISK THAT I DID OPEN BUT RESEALED...SORRY....I HAD TO THUMB THROUGH THE MANUAL JUST ONCE =) ITS MINT HOWEVER WITH WARRANTY CARD INSIDE
- AND OF COURSE, THE POWER SUPPLY....

THE SYSTEM ITSELF IS IN THE ORIGINAL BOX WITH THE COMP WRAPPED IN PLASTIC AND IN THE STYROFOAM PACKS. OF COURSE I TOOK IT OUT AND TESTED IT WITH MY SC1224 MONITOR WHEN I BOUGHT IT. SINCE THEN ITS BEEN BOXED AWAY. ITS A BEAUTIFUL COMPUTER. THE FALCON LABEL HAS THE PROTECTIVE CLEAR PLASTIC OVER IT FROM THE FACTORY. I WAS ORIGINALLY GOING TO USE IT FOR MIDI AND AUDIO APPLICATIONS BUT NEVER MADE THE SWITCH FROM MY STE. I ALSO HAVE CUBASE AUDIO COMPLETE WITH DIGITAL INTERFACE. UNLESS I GET WHAT I WANT FOR IT, ILL JUST LET IT KEEP COLLECTING DUST IN MY CLOSET. IM IN THE U.S. MAKE AN OFFER =)

Maybe the RAM disk is the best idea. Most ST RAMdisks should work. I used RAM Baby from the 1987 ST era, and it worked fine. Changes size on the fly too.

John

Are there any games that will run in 4Megs, but not in 14?

There used to be a couple of old games that would only run in 512K on a 520, but were made obsolete when the 1040 and MegaST came out, but that was ages before the Falcon was even dreamt of. From then on, programmers stopped making stupid assumptions about RAM size. Instead they made stupid assumptions about TOS versions, floppy drives and video chips.

It sounds like your problem has more to do with a TOS version or some incompatibility with Falcon hardware than purely with memory. Have you tried Backwards ?

well Someone called it on 300.00 but I want to give everyone a chance.
Right now Im going to ship it back to Chromagic.
There chris will try to get the CenturboII working and if that cannot be done then he will reintall the old mother board.
It SHOULT NOT sell any higher than 400.00 with a working centurboII and 32 megs of ram.
If we cannot get it working then It should sell from 250.00 to 300.00.
Now ive got the offer for 300.00 but if anyone offers 400.00 for the way it is right now ITS SOLD!

I dont want to play auctioneer.

If I do not get a bidder then it will be sold either for 300.00 (if the old mother board is put in correctly - shouldn't be a problem)

If that bidder does not buy at that time than the 250 in three payments will get the computer.

So if anyone offers 400.00 as it is (I will have Chris at chromagic send the mother board to the same address as my Falcon).

reguards fellow atarians,

Gene

The problem is definately RAM, I have a CPX which limits RAM and everything works fine. So an auto folder program would be ideal.. i.e. Kill the extra ram on boot up, not after a reboot. It's just a time thing, really. TOS is 4.04 using AHDI (scsi dramas with HDDRIVER 7) and thats about it.

Cheap and easy solution for this is to build simple converter 13pin-din
-> 15pin d-female and use any vga-screen. Works great for me.

Hi Y'all

Ive got an IMG i want to addapt to put on my Jinnee desktop, but its got a white background to it!. I want to get rid of this white bit so's the IMG will blend into the background, but i cant work out how to do it, any ideas?.

It seems i want the 'paper' to be transparent, or the picture 'cut out' somehow, but how do i do this with an IMG??.

What really I need is a solution for the external diskdrives.(Yes, my old 520 ST is still running, with a lot of upgrades, and as you know, this model has only external drive) Can I use a PC diskdrive making a cable for conecting it to the external port of the ST?

Do you know if I have to try conection directly the HD in the external box of the original Atari external Diskdrive? or must I try to connect directly to the computer disk drive port?. Are the external diskdrive contained in the Atari external box similar to the diskdrive internal in the newer ST versions?.

OUTSIDE was an virtual memory manager.
But i can�t say if it works for games. Never tested anytime.

OUTSIDE / payware from Uwe Seimet.

Regards, Robert

Yes, you can made a cable, but you need the right plug to connect that
drive to the st floppy port. Watch drive jumpers 0 or 1 (A or B)

> Do you know if I have to try conection directly the HD in
> the external box of the original Atari external Diskdrive? or must I try
> to connect directly to the computer disk drive port?. Are the external

With an external HD floppy drive you missed HD select signal on atari st
floppy port. Not enogh pins on floppy port. Needs also add on electronic
to switch between HD/DD mode. Some modification around the web, also in
DOITST.

Also you can use a HD drive as floppy drive, simple as DD drive.
No modification needed.

Only drive select 0/1 on floppy pcb must be changed.

Regards, Robert

STBOOK info from atari's glossy flyers.
(It all seems to be correct when compared to my STBOOK)

Features
8.5" x 11.4" footprint, 1.4" think
Weight 4.2 lbs (not certain which battery pack)
Up to 10 hours batter life (no idea, my battery is about shot I need to rebuild it.)
TOS in ROM (2.06 I think)
Built in transfer software.
Built in Vector Pad pressure sensitive pointing device (Best has replacement mylars for these still) I personally recommend an external mouse using a serial mouse driver.

Internal expansion port (modem would have went there if they had made one)
Internal 2.5" IDE hard drive

Specifications
CPU8mhz 68000
RAM 1 Mb (did they make a 4mb) low power pseudo-static RAM
ROM 512k internal. includes TOS, file transfer and hard disk utilities

8mhz, 16 bit BliTTER chip

Keyboard 84 keys. (actually fairly nice) Full-size Atari Keyboard can be connected. (I would like to know how, no way possible that I know of, I think they may have been planning on doing this)

LCD 640x400 reflective Super-Twist Nematic (STN) (fragile and there are no more to be had if you break one)

Sound
Programmable sound generator with 3 voices. (NOT DMA SOUND - NOT STE SOund)

Expansion
120-pin full function expansion connector, allows full acces to the main CPU bus.

IO
MIDI in
MIDI out (These are both through mini din connectors, BEST has Atari converters to take them to normal midi ports. Might be cheaper elsewhere)

RS232 (normal 9 pin)

Parallel port

ASCI port. (Not normal size, this uses a small cable that came supplied by atari. Best still has some replacements of these)

Batteries

2 versions
1 case that holds 7 Alkaline 'AA' batteries
1 Rechrgeable NiCad batter pack, with AC adaptor. (I have one of these, anyone know a good place for purchasing the replacement cells?)

AC Adaptor
-(Delta)V recharge algorithm extends battery life. (optional) Rechareges in less than 2 hours, while computer is running.

Pointing Device
Antari pressure-sensitive VectorPad (tm), using built in Force Sensing Resistor technology. External electro-mechanical mouse can be connected.

Hard Disk
19 ms average access time. 40/80/120 Mbytes capacity.

(From the ST Book User manual)
Addendum
STBook has a connector for an external keyboard or numeric keypad. Atari does not manufacture these peripheral items, but suitable units may be available from your local computer retailer. In the near future, Atari will supply an optional external mouse, which wil attach to your STBook through this same connector. (Never happened that I know of)_

Graphics Resolution ST High (640x400)

Power Consumption 1.5 watts (average)
11 watts (maximum)

I can get you the pin outs if you want. But I'll do that in a graphic format as they are odd connectors for some of them. Let me know via email if you want (I sometimes don't read news for a week or two)

This was an early UNIX like operating system that was advertised in early ST mags. It has a following in heavy duty business apps on other platforms, but never really took off on the Atari platform.

Hello,
I am looking for OS-9 for the Atari ST ..
If there is anyone out there would be interested in
selling their copy of OS-9 please contact me via email...

thanks ...

what is os-9 for the atari?

Like I know it's an operating system, but from who?

specs?

web site, perhaps?

thanks
chris.

backward works but needs the machine to be rebooted, a ram disk will gobble
up 10meg from the auto folder on boot up. Incedently I think outside may
have become shareware or freeware.

Cumana in the UK marketed a version of it.  You had a cartridge for the
cartridge port, and it had a switch for either Atari 68000 mode or OS-9
mode.  I got a copy of it with a used Mega 4 I purchased.  I
accidentally trashed two of the floppies before I realized what I had
done.  I was never able to locate replacements, so I eventually tossed
it in the trash.

Definitely a multitasking system.

kI would not call it UNIX like. The differences are far to big to call it UNIX like. However, it does have a simmilar IO system call interface.

OS-9 from Microware (this is the manufacturer) is an OS for embedded systems. It is highly flexible and can be used on a wide variety of systems. It can operate on diskless systems running completely from inside the ROM, It does provide interfaces for easy and modular writing of device drivers, adding system extensions (even new system calls), adding hirarchys to the file system tree, managing resources like IRQ vectors or memory,... You even can sybolically debug programs from ROM, that means OS, debugger, target program and debugging symbols all are in ROM, running out of the ROM.

Does anyone know why the host adaptor in the shoebox SH204 will
not communicate with a more modern 3.5inch drive.Ihave tried several
drives including Fujitsu 2624F, Maxtor LXT340SY and even an older
Seagate 5.25 inch ST2383N but none operate properly yet the original
drive works perfectly. Any help much appreciated------ Bryan

If the SH204 you have is like mine, the drive mech is not SCSI
it is MFM which very old. Someone else please jump in if I'm
in error, but I am pretty sure the Tandon (<-spelling) mech
is indeed MFM technology.

If I recall correctly, the MFM mech had a SCSI-MFM adaptor piggy backed,
and you could just remove it and put in a SCSI drive. Newer drives not
supported. 200-500MB range about max.

John

Great! Good to know theres still stuff going on...

I've been looking around and around and around for
all the OS's for the 68000 atari's, you could say
I'm collecting them, so I'll check this one out.

thanks

chris.

Hello, I have an old Atari 520STFM with the internal supply that has gone bad. Its output voltage is only 3-4 v on the 12 v output and 1.5-2 v on the 5v output. I have replaced mains filter cap, all caps on the outputs, the opto-isolator and a 3-leg IC HA17431P. There is a potentiometer in the voltage-sensing circuit, but adjustment doesn�t affect the output voltage. I would be grateful if someone could point me in the right direction to get this old gem running again.

Greetings
Mika Danielsson

You should find what you need at Vezz's hardware page:

http://www.freeweb.org/computer/vezz/atari/hardware/index.htm

Hi

IIRC the most common problem when they go, is that a transitor buggers up
and causes an e/capacitor to go. I've seen one with a nice hole in the can.
The trany is usualy Q2, and maybe a diode or 2!

The PSU's that I have here at the moment don't have the pot. that you
mentioned, although I have seen that type.

You are a brave man! Why not look for a ready made expansion board such as
Frontier?

I have done this job myself but I'm afraid I forget the souce of the
instructions. It will keep you busy for days (maybe even weeks) on end. It
relies on doctoring some larger chip sockets to fit the PCB tracks of the
ST. You will end up with more than 512 hand-soldered joints and a large

number of hand-wires. When I thought I had finished the job I had 3 'drys' left which took an absolute age to diagnose.

Bonne chance :-))

Roger

I never discovered why, Brian, but I have had the same problem trying to connect a 330Mb IBM DSAS drive to the host adapter supplied in the Megadrive box. It still drives the clunky 50Mb Seagates but fails to recognise the bigger, more modern ones.

Just a guess but it could be something to do with signal timing - perhaps it is just not quick enough on the uptake :-)

Roger

Hi Mika,

try to disconnect the PSU from machine and then measure its ouptut with possibly

some light load, which must be on 5V side (something like 20 Ohm resistor). If your
output voltage become O.K. then it�s probably only main transistor too "tired".
Usually it�s BU508. Replace it & try again. HA17431 is only some kind of gated zener diode
which is used for feaadback loop for regulation of 5V side. Optocopler also plays that role...
If at lighter load everything seems fine, then regulation works, only BU508 can�t pump enough power
into load to achieve desired voltages....
That potentiometer you mentioned is for voltage finetuning and you should not touch it if voltages are already
way out of reach (it means that failure is somewhere alse)., but you can use it later, when PSU starts behaving
sensibly to tune optimal values on all outputs with load connected (=rest of computer).

Regards

Branko

Megadrives are either RLL or MFM, not SCSI or IDE.

The old SH20x drives were made up of two host adapter boards, one ACSI>SCSI and one SCSI>MFM, so you could unplug the second board and stick a SCSI inside. Some of these were limited to 20Mb by hardware though.

On the Megadrives, they made the 2 adapters into one board, so the SCSI signals are probably on their somewhere, but it would be very tricky to get it working.

Thanks for your very detailed reply! I have only measured the voltages when the supply is connected to the mainboard and when it is disconnected. I�m going to test with a dummy load tonight. The transistor is some japanese 2sc type but i�ll check for a substitute and replace it too.

I am fixing an STE PSU, & it appears the cause of failure was the main
electrolytic capacitor "drying out". This happens after a few years with the
parts, sooner if the parts are in a hot casing.
```

The main transistor has to work harder, & fails after a while.
In my situation, a power resistor has also overheated, & the driver transistor has also failed.

Hi

Well the SH204's I've had and seen are MFM and nothing else! I looked into it when I first got one.

I never got a technical explanation. The issue came up when I was trying
to use a newer drive in an ICD FA*ST drive. Tom's answer was that that
1987 SCSI host was discontinued for that very reason: not supporting
newer drives, and his answer was for me to buy an ICD Link to support
it.

OK thanks for your thoughts.

I still can't understand why I can Format and Partition the drives mentioned and then not get the system to recognise it on reboot. (although the Maxtor shows up on the desk can't write anything except gobbledegook to it) On the verge of giving up but it seems such a shame----.Bryan

Having suffered a very bad HD failure I have lost a recently obtained Email address of someone who thought they could find some old info about uprating the internal powerconverter inside the STacy to cope with a larger HD and maybe an accelerator. I would love to hear from this person again TIA :) ----Bryan

Hi Mika

>Hello, I have an old Atari 520STFM with the internal supply that has gone
>bad. Its output voltage is only 3-4 v on the 12 v output and 1.5-2 v on the
>5v output.

Without seeing which supply you have its difficult to give you specific help, there are
about 7 varieties of everyday supply in existance and numerous other short run's. Ive
got about 30 PSU's here at the mo and no more that 2 matches in appearence.

If i had that problem i'd be looking for some resistors in the start up bias circuit,
they could be either 1 470Kohm or 2 180Kohm res's near to the mains smoothing cap. There

is also the possibility of leaky recifiers in the secondary, after that it'd be
out with
the DVM and the coffee machine.

Once its working, take note, if youve tweaked the set HT pot, start by measuring/
setting
the HT off load, to be safe, set the 5Volt rail to between 4.5 and 5.25 volt on
load, 5v
being prefered but it will drift as it warms up. If with the voltage set to 5V you
get
random crashes then set it to 5.25 Volt.

Pure fantasy, as you put it...

But it wouldn't be too hard to actually implement, even
easier to do on a none intel (i.e VGA/CGA) box, that is
it would look better, in the text mode of other computer

types (esp. Amiga...Woops).

I bashed it up one day when I was bored, but I had been
meaning to it for a while.

I really get into computing platforms other than PC (and
I'm not alone, I know..), I like to collect OS's for each
machine I have, and I suppose I even dream about ones that
dont exist yet (i.e my sig?).

The release of Minix 1.5 for 68000 machines is great, I've
been pulling down everything I can get of that recently.
Do you know of any other OS's (must be free implementations
though) available for the Atari (68000 only, I know...but I
dont have a falcon or a Mega 4 yet)?

chris.

WARNING........ LONG POST!

Here is a solution, ending my miserable hard drive/power supply problems for my STacy. Have you wanted to replace your inadequate stock CONNER hard drive with a larger model? You may have found that there isn't enough power available from the stock power supply, and with goodies like GCR, the entire computer crashes and reboots.

WHY??...... The stock PHIHONG power supply's specifications are: 16.5V at 2.5 amps. I found by watching the oscilloscope during floppy and hard drive accesses that the external power supply can deliver EXACTLY 2.5 AMPS and NO MORE! If the load exceeds 2.500000 amps, it shuts down until the load has returned to under 2.5 amps.

Nothing seemed to help. I tried tweaking the 12 and 5V potentiometers on the internal power supply board, trying other hard drives, large filter capacitors on the 5 and 12 volt lines and trying non-ATARI floppy drives. No luck here....

THE SOLUTION!......was finally discovered when I realized that by improving the filtering and stability of the power supply, the transient current loads no longer exceeded the maximum supply ratings. Simply, de-solder the 5v line leading to the hard drive at the power/regulation board. Solder the input leg of a LM340K-5 (5v, 3amp positive-voltage regulator) to the 12v line. Solder the case (GND) to the GND terminals between the 12 and 5v lines on the power supply/regulation board. Solder the wire leading to the hard drive 5volt line to the output leg of the LM340K-5. This solution has been flawless, running an impressive 2 years now!

```
---------------
         (5v)  |
             O |               _________________> 5v to hard drive internal

Possiblee STacy screen - fix!!!!

(well, at least it worked for me to improve my screen brightness about 80% anyway)

I found that there was a open circuit (partial broken circuit) on one of the wires leading to the control box adjacent to the screen. I found that the wire was broken inside the plastic wire jacket and was hard to find. I discovered this little feature when I was fiddling with the screen to measure voltages and voila'! The screen blacked-out.

The culprits are the two white wires leading into the top of the control board near the center (brightness) control potentiometer. It seems to be ATARI's fault, as the wire was broken cleanly exactly at one of the crimped ends. This increased the resistance of the brightness control, decreasing the screen brightness.

I stripped the bad wire, soldered it back to the connector and cleaned the terminals (chemical oxidization cleaning spray) on both ends.

Wow! now at least I have a working night light! :^)

Hope this helps y'all!

Phil McCandless

Long post... (but of course, it's worth it :^)

OK, I know you have all been asking for a Screen Fix for the STacy, and I am working hard at trying to find one for y'all! (that's Southern DRAWL y'know)..

Well, I have probably the BEST temporary fix you'll ever need and probably ever want for your STacy. Let's face it folks... We will NEVER see a bright screen. Just drop it for now and follow these next instructions for improving your machine....This way will make the screen MUCH MUCH MUCH brighter than the original, and as bright as my SM 124 Monochrome monitor!!!!!!!!!!! (NO LIE, FOLKS!)

Since we all have resorted to using an external 15 watt flouresent desk lamp for illumination, the trick is to pass that light through the LCD screen onto a highly reflective background. Note that as the STacy screen dims, the flat background light gets a little darker as well. This creates a dark background on which dark letters of the LCD must be read. If you replace that dark background with one of a higher reflectance, you get a VERY BRIGHT and super accurate screen! A piece of white typing paper works fine, and I guess reflective paint will also do the trick.

DISCLAIMER: Do stupid things to your STacy, expect stupid and possibly permanent damage to your machine. Don't blame me for your fumbles. I ain't responsible!

Step #1 UN-PLUG!

Step #2 Open STacy lid (top cover) y'all know about the breakey tabs don't you??? Two screws behind the ATARI STacy logo will help open the case.

Step #3 remove all screws and wires/connectors on the LCD screen. Remove the RF shield to access the LCD screen. Note polarity of large 4-pin connector.

Step #4 straighten all grounding tabs I don't know haw many and remove LCD screen.

Step #5 Cut a piece of white paper the exact size of the screen andslide the paper in between the flourescent tube (flat sheet of pink-brown stuff covered in a thick plastic.) If you want to get creative, try placing some textured paper in there to see what nifty screen effect you can get. you can also try highly reflective paints.

Step #6 Do everything in reverse.

Voila! as long as you use an external light source, you will be
able to see the BEST SCREEN YOU HAVE EVER HAD! Guaranteed! I think
that the reflective screen actually is more readable in ambient
light than was the original back-lit version.. Heck, you can't loose
with this one!

Lood Guck!

Phil McCandless

Hope this helps

Regards,

Rich

I'd be surprised if there weren't a freely-copyable version of
curses out there somewhere, which I'd think would go a long way
towards implementing it.

James Jones

I have one with box, manual, good condition, that I suppose I don't need
any more.

Email me on <johnnie@ligotage.demon.co.uk> for more details. I'm in the
UK.

Salut/.

J/.

Yes there is SCSI in a SH204. The flatcable between the two prints
connects 50 wires.
But als told here you have problems with modern drives, possibly
because of arbitration.
Remember: that card in the SH204 was the first SCSI adaptor from
Atari so it cannot be better than what they put in the Mega STE.

Met vriendelijke groet,

Ronald van der Kamp

news:391b5f3e@naylor.cs.rmit.edu.au...

: The release of Minix 1.5 for 68000 machines is great,
: I've been pulling down everything I can get of that
: recently. Do you know of any other OS's (must be free
: implementations though) available for the Atari (68000
: only, I know...but I dont have a falcon or a Mega 4
: yet)?

You mean Minix the OS, not just the filesystem? It works nicely on your ST? Tell us more! Btw, the sources are here: http://www.cs.vu.nl/~ast/minix.html

I posted a short note on QNX recently, they'll be releasing the sources to the public real soon now. (Download here: http://get.qnx.com) No licence fees for non-commercial users. With some work I suppose it could be made to run on both Ataris and Amigas. Hardware specifics, like video and port drivers etc, would have to be taken care of separately for each platform. If you're curious you can download a demo diskette image for the PC from their site. I've tried it, it's quite impressive.

There was another Atari ST cartridge based OS from the UK advertised in magazines, but it seems it never caught on. It had flash EPROM:s and could be upgraded. Shame I can't remember it's name, SMS? SME? SMG? Anyone?

If you can get ahold of a Power Macintosh that supports 16-color mode (4 bits per pixel) you can install this:

ftp://ftp.machack.com/Hacks98/asciimac.sit

"Filters all display output and turns it into ASCII art in real time, in honor of the disturbing resemblance between the iMac and old VT100 terminals. Best Hack and winner of the coveted Victor A-Trap trophy! These MacHack newcomers from MIT wowed the crowd."

Such a Mac is a rare beast, most of them bottom out at 8-bits per pixel. I personally haven't seen this hack in action. But it sounds really cool.

It wouldn't surprise me at all if there was a whole
movement for the advancement of TTY terminal computing.
The VT100 club? Saw something that looked like textbased
drop-down menues in the Octopus BBS system for the Atari.
Why not a complete WIMP? Here's something to start with...

Well, I disagree with that because the card in the Mega STE was deliberately crippled, and is not a full SCSI implementation. In fact, I've had to remove the mechs and format them with other hosts because the STE host apparently cannot even format.

These are the same symptoms I got with non-supported drives.

I can vaguely recall a name from around 1988 or so:

Microwave? Microware? Microwire?

Anyhow, whatever happened to them?

Were they bought up in the massive "if you can't beat 'em, buy 'em and shut 'em down" frenzy of the early 1990s?

> specs?

AFAICR, it was a real time, multitasking (multi-user?) OS designed for the 68k processor, and available for the 68k micros (ST, Meagre, and Mac), and later ported to lesser creations like the x86 range by that small company that virtually no-one has ever heard of [was that IMB? MBI? MIB?]

Correct. And now several other architectures. It is still in use in embedded
applications, even if not now on desktop machines.

hi,

it doesn't need a boot disk, as the OS is built in. If you just turn it on with no disk in the drive, after about 30 seconds the 'desktop' should appear - 2 drive icons and a trash can.

If you don't have a mouse, you can use the alt key and the cursor keys to move the pointer around. use alt+insert as a left click.

software is available at loads of places, some good sites to check first are:

http://bales.online.fr/atari - the 'quick faq'
http://www.dhs.nu - dead hackers society - utils and current news
http://www.atarist.com - loads of games

cheers, Phil.

Actually you're jumping in a bit late here, OS-9 was designed for the 6809 processor.   Yep a multiuser/multitasking/realtime operating system for an 8 bit processor that would be happy with 16K (yes that's kilobytes) of memory. It is still quite widely used in embedded systems.

>

Microware was an existing company, making software for the 6800. They may have been making other software, but what does come to mind was that they had improved monitor ROMs for the various 6800 systems, as improvements for the MIKBUGs etc issued by Motorola. One of Microware's monitor programs allowed for multitasking.

The story I read a long time ago was this. Motorola had designed the 6809, based on study of how the op-codes of the 6800 were used, and also input from users of the CPU. The 6809 design was intended to handle high level languages easily, hence the two stacks and all the addressing modes.

Motorola wanted a BASIC for this new CPU. I never heard what they intended for the interpreter, to sell it or give it away, or whether they wanted to show off the fancy CPU or have BASIC available to sell the CPU. So Motorola went to Microware (and who knows why they didn't go to Microsoft). Somewhere along the way, Microware decided this new BASIC needed an operating system, and so they created OS9.

I have no idea how it happened, but one nice thing was that Radio Shack got behind the operating system, and you could buy it there for the Radio Shack Color Computer, which ran the 6809, and it was less expensive than the versions being sold elsewhere.

When Radio Shack came out with the CoCo III in 1986 or 87, which included memory management and 128K of RAM (and the ability to deal with 512K of RAM), they also sold OS9 Level II, which needed an MMU, for it.

I had OS9 for the original CoCo, and the horrible screen on the original did not make it all that practical. But Level II on the CoCo III (which had a descent screen) was great. I could load the operating system, and a text editor and whatever other tools I needed at a specific time, and just swtich windows to get to the needed tool. And with 512K of RAM, I never seemed to run out of space. Towards the end of the time I was actively using the CoCo (1993), I added a 720K drive, and the operating system and a text editor and anything else I needed would fit on that disk.

When I moved to a Mac Plus, it was a step backward, though I suddenly fit a bit into the mainstream computing world. The 1 Meg of RAM was pretty much dominated by the operating system. I couldn't really run things with only one floppy drive since the software was so much larger and ended up with my first hard drive. The better computer didn't really give me much better operation.

The sad part was that with a number of low cost 68000 systems, Microware never really came out with a low cost edition. They did have OS9 for the Atari ST for about a hundred dollars at one point, but it did not include any development tools; the full version for the ST was considerably more. I would have loved to run OS9 on a 68000 machine. One of the St magazines once suggested that Radio Shack ought to sell the Atari ST as a logical successor to the CoCo, which did make a lot of sense, especially if they brought OS9 along with it. But that never happened.

Michael

Would anybody know of a program or CPX that let's Cubase use the complete screen of an SM 124 monitor instead of only about 70%? - and wher to get it? I'd like to get rid of these large borders and the SM 124 does not have any vertical or horizontal adjustment knobs.

Your help is much appreciated.

Regards,
Rony

Hi Rony,

The knobs are inside. There's documentation on the net (somewhere) on how to do it. I'll try and dig out the URL for you.

Mark.

You are better off getting a VGA monitor you will get a physically bigger screen. Now that Videlity is shareware you can even get aroun 800x608 screen res. Heaps better than the sm124's 640x400.

Mark Bedingfield

Like Mark said, the knobs are inside the case, it's fairly easy to get the lid off and adjust them if you want, more info is available at Vezz's pages:

main page: http://www.freeweb.org/computer/vezz/atari/hardware/index.htm

the one you need:
http://www.freeweb.org/computer/vezz/atari/hardware/zip/bigmono.zip

cheers, Phil

But remember the reason for those big borders -- on
the SM 124, one inch of screen space just happens to

be one inch of printout.

Nice touch, I thought.

Hi Uwe

>> As far as i'm aware this is only possible with a Link96 and HDdriver, which
>>translates

I wouldnt normally challenge a Guru such as yourself, but that is one of the points i
heard mentioned when i bought my Link 96

>No, a LINK97 is required. The LINK96 will block the bus so that no other device except
>the ST the LINK96 is connected to can access other devices.

You wouldnt find the Link 96 connected to a ST, the 96 is a MegaSTE specific piece of
hardware.

>As far as I know this is the main difference between LINK96 and LINK97. In this case
>it's crucial.

The information on http://www.wbsystemtechnik.de/atari/in_ho_e.html says that
'whilst the SCSI bus is free' another device /is/ able to access the devices on the host
bus, using the 'SCSI Bus Free' feature.

My friend has made a network like this between two Amigas, using a hard drive as an intermediate medium. I've also got a description for doing a similar thing with a PC and an Amiga. However, this requires some sort of protocol for handshaking, which is done using some cable between the serial or joystick ports.

If anyone is interested, I could sponsor a developer with a SCSI-ethernet bridge, usually used for the Mac. Don't know how easy it would be to acquire any developer information, though, I think one would have to 1) look at the NetBSD sources for one such device and 2) debug and disassemble using a Mac or Mac emulator.

What kind of drive format are you referring to? The PC uses an MBR (Master

Boot Record) to allocate its partitions, and I suppose that the Atari uses the same MBR, but the Amiga uses an RDB (Rigid Disk Block) for the same function, and the two are not compatible, filesystems notwithstanding. The Mac also has a format of its own, AFAIK.

Not a bug, just a design limitation. Warp 9 is designed to work with the desk accessory. The code that makes mouse accelerators/controls, replacement fonts and screensavers work is all contained within the ACC.

Code for keeping W9 compatible with other programs (i.e. turning screen acceleration and fastloading on/off for incompatible software) is built into the auto folder program. The configuration utility can be used in lieu of the ACC to load your list of incompatible software on machines short of space, but it doesn't add the features available in the ACC.

If you are short on ACC slots, you might try adding the Geneva OS (which allows limitless DAs), Multidesk (a bunch of DAs fit in one slot), or Chameleon (loads and unloads a single DA as you need it).

Thank you for replpying to my request for help, but the Warp9 handbook is very specific that the WARP9CFG.PRG can be used to load all the options saved in the .CFG file (except desktop picture, custom font and custom fill options; I only want the block option) PROVIDED that this .CFG file has been set-up using the .ACC file itself. The switching on and off of the facility for specific programs which you mention below uses a separate .DAT file.

Unfortunately none of the .ACC options you mention in your final paragraph is suitable for the disk-based system I want to use this on, but I am familiar with and find Chameleon very useful.

Last year when all I had was an old NEC CD-ROM between the Falcon and my AT both machines accessed the external device OK [the AP-10 PCI scsi card from SIIG hasa feature that if you jumper a peg on the board termination is automatic] but now that there is that plus a Zip 100,CDRW(in their own minitower) & Microtek E3, the Falcon is not reading the devices, though it may be me.

I may not have the SCSI IDs in sequence in relation to the Falcon [I'll have to open both boxes to see], Winblows doesn't seem to care about the order and so far I've been too busy/lazy to make the changes.

Though I suspect once I do, it would only work with removable media not hard drives and the scanner of course would need OS specific s/w in each machine.

Yes, I use Iconnect under MagiCMac with STip to access my cable connection.
AFAIK STip is only necessary if you wish to connect via macos. With a
standard dialup connection you do not need it. Make sure that you do not
have that box "connect via macos" (or similar) checked!

Hi John,

Would the ROM switcher work on North American 1040 STe's?

My 1040 STE's TOS 1.06 ROMs are soldered to the motherboard.

g'day

I was referring to the Atari, PC and Mac (I didn't say anything about
the Amiga). These three platforms can all handle DOS compatible media.
For the Mac additional software is required. For the Atari you can do
without additional software when creating a partition that is DOS and
TOS compatible at the same time.

I might well be wrong but that's the difference between the two versions
of the Link as far as I can remember. It's safe to simply try it with
the LINK96. If it works it's fine, if it doesn't it won't do any harm to
your hardware.

> You wouldnt find the Link 96 connected to a ST, the 96 is a MegaSTE specific

That's definitely not correct. I have a LINK96 at home, connected to the
ACSI port of my TT.

> 'whilst the SCSI bus is free' another device /is/ able to access the devices on
the host

Does this refer to the LINK97 or LINK96?

Nicholas, thanks for your answer.
AHDI gives me "Identification failed" for my drive, but was able
to format and partition it. I then installed the shdriver.sys.
The drive boots now and is accessible as C.
Thanks again!

Yours, Robert

Can't see why not.

>
>My 1040 STE's TOS 1.06 ROMs are soldered to the motherboard.
Thats more difficult.  In the upgrade for the TUS board, the old roms
get removed and the board fitted over the top.  You could unsolder
them.  Or disconnect pin 22 (I think thats OE) and solder the board
over the top of the old roms.

Hi again Uwe

>I wouldnt normally challenge a Guru such as yourself, but that is one of the points i
>> heard mentioned when i bought my Link 96

>I might well be wrong but that's the difference between the two versions of the Link as
>far as I can remember.

Your right there, that is the difference.

>It's safe to simply try it with the LINK96. If it works it's fine, if it doesn't it
>won't do any harm to your hardware.

>> You wouldnt find the Link 96 connected to a ST, the 96 is a MegaSTE specific piece of
>> hardware.

>That's definitely not correct. I have a LINK96 at home, connected to the
>ACSI port of my TT.

The manufactures seem to think the Link 96 is the MegaSTE specific card, the '97 is the
external ACSI to SCSI cable type, and the new '97 internal is the build into a box,
ASCSI to SCSI adaptor with ACSI through port.

>> 'whilst the SCSI bus is free' another device /is/ able to access the devices on the
>> host bus, using the 'SCSI Bus Free' feature.

>Does this refer to the LINK97 or LINK96?

Referes to the Link 96, ive just checked my user manual and the manufactures web site to
confirm.

GO have a look Uwe, its at http://www.wbsystemtechnik.de/atari/in_e.html

This is funny. When I got my Link he thought otherwise :-).

Hi

The only PCI S3 in the shops nowadays is the "S3 Savage".
It has 32 Mb and can do 300MHz.

My current S3 Virge is 2 Mb and seems to be able to do a mere 110Mz.

Is MILANDRV.PRG able to drive this thing in some basic mode?

Thanks.

Some years ago one of my customers in fact showed me a SCSI system for his two Ataris that actually did shared SCSI. It seemed to be a combined hardware/software solution. The adapter was made in Germany and had a name like L.... something (maybe LADAP?). The autor of the program was a person with a long greek surname, L........is, but I can't remember it for the life of me. The setup seemed to work only when using the L.... software, SCSI-Tools or ICD didn't work.

I also asked around on some other newsgroups and got mixed replies. Someone said that it worked nicely on their NT system, someone else mentioned that it worked on Solaris, but wasn't officially supported.

MG

Here's a reply I got from comp.sys.sun.hardware:

It is possible and it works fine (after some work, of course) on our systems. We have ported the mainframe operating system BS2000 (similar to MVS) to MIPS procerssors. BS2000 is capable to share disks between several hosts with simultaneous access. On the original /390-hardware the disks were connected to the hosts via ESCON or OEMI channels (/390 proprietary peripherals). On the MIPS machines we wanted to use SCSI peripherals so we had to support multi-hosted SCSI to have the same functionality as on /390 hardware.

Critical read/write sequences are synchronized between the hosts using SCSI reserve and release. Additional work had to be done to react correctly when reservation had been lost due to SCSI resets. Most disks we tried worked without problems, some RAID systems had problems under high load, but these problems were fixed in the RAID systems.

This scenario is the most complex. With "normal" UNIX systems it should be no problem to use for example different partitions of one disk from two hosts simultaneously. May be you have to take care of SCSI resets during boot of one system. And you should choose the SCSI-Ids of the hosts and the disks carefully!
The hosts should have a lower priority on the SCSI-bus than the connected devices, otherwise you might run into trouble.

Hi all

I was wondering if anyone has any experience with this harddisk. It is
a Seagate U4 Model: ST38421A, 8.4 Gbytes. Had a discussion with Uwe
about it but it reports some strange numbers when looking in HDDutil
so he can't help me. Anything, anyone?

Hi Uwe

>> The manufactures seem to think the Link 96 is the MegaSTE specific card, the '97 is
>> the external ACSI to SCSI cable type, and the new '97 internal is the build into a
>> box, ASCSI to SCSI adaptor with ACSI through port.

>This is funny. When I got my Link he thought otherwise :-).

So he's trying to wind us up!!, he's giving us conflicting manuals and conflicting
information on his WEB-site. 8~)

So i take it you have the Cable type Link-9x

So it seems like a troublesome way to go, directly sharing SCSI-drives among two computers. What if we would instead treat one of the controllers in a subinordinated way? Meaning that the sub controller would always read and write thru the dom (dominating) controller. This way all reads and writes would be done by the dom. Some of these would be r/w requests from the sub, some would be native dom r/w. Backside of this is that the sub would be handicapped without the dom.

I really can't claim any detailed knowledge in this field, so I don't know if this is doable at all?

Correct me if I'm wrong (I'm just as much in the dark as you, Martin), but is it possible for the SCSI interface to be a target device? When I talked to my friend about SCSI ethernet adapters, he couldn't see how they would work, claiming something to that effect.

Yes, this is possible and supported by current versions of HDDRIVER. It
should be possible to write a TCP/IP over SCSI network driver using the
target interface.

Yes. However, this requires a "real" SCSI controller, ie. at least a TT or Falcon.

This is in response to the question about how to connect a Roland synth with a presumably CGA video output to an analog RGB monitor.

Provided that the synth really has a CGA output, and not knowning the exact pinout of the monitor, this is the suggested way of interconnecting them:

```
'CGA                                    Analog RGB
'
'
'
'
'            +-----+
'        +---|R1K |-----------+
'        |   +-----+          |
'        |                    |
'        |   +-----+          |
'6---I---*---|R1K |-------+   |
'        |   +-----+      |   |
'        |                |   |
'        |   +-----+      |   |
'        +---|R1K |---+   |   |
'            +-----+  |   |   |
'                     |   |   |
'                     |   |   |
'            +-----+  |   |   |
'3-----R-----|R470|---*-----------------------R
'            +-----+      |   |
'                         |   |
'            +-----+      |   |
'4-----G-----|R470|-------*-------------------G
'            +-----+          |
'                             |
'            +-----+          |
'5-----B-----|R470|-----------*---------------B
'            +-----+
'
```

```
'
'            +-----+
'8----Hs-----|R470|---------------------------Hs
'            +-----+
'
'            +-----+
'9----Vs-----|R470|---------------------------Vs
'            +-----+
'
'
'
'
'1,2----GND-----------------------------------GND
```

The signals are:

R   - Red
G   - Green
B   - Blue
I   - Intensity
Hs - Horizontal synchronization
Vs - Vertikal synchronization
GND - Ground

Please note that this is untested! The RGB part I'm sure is OK but the Hs+Vs lines could possibly need some experimenting. Try the above solution first, nothing will blow!

Please take also a look at this site, where you'll find lots of information on various connectors and adapters:

http://www.hwb.acc.umu.se/menu_Connector.html
(No, the one above is not included in the lot!)

I guess you could have two monitors displaying the same picture with a Y connector.

There is no means of setting up 2 different screens with a different display on each monitor.

...BUT, I seem to remember (this is reaching back), of a debugger program that used the french Minitel for text output while the program was running on the ST's screen. Or was it on the old CPC ???

For those who don't know what the Minitel was, these were cheap text terminals that were given away for free by France Telecom in the early 80's. This was the ancestor of the internet. There used to be one in (nearly) every home in France and they are still quite widespread.

Heyas ...

hm so now i am looking for all documentation on midi on the atari
(code-wise .. aka id like to know about that mros stuff etc ...)
right now i am writing my own routines for midi in/out, replacing the whole
tos midi/kbd interrupt-routines etc ... but somehow i have the feeling that
this is not the best thing to do ... if you have some docs of this or
similar kind,
please let me know ...

felix

When using mintnet ovl with ssl I sometimes get an alert
box saying that the post has been redirected and I'm giving three options
Get this   Repost   or Cancel

No matter which one I choose I will receive about 26 bytes and then it's
off to timeout 1,2,3.. and so on

I seem to have some luck when pressing the esc key but most of the time
most of the page is not loaded properly.

Should I just wait it out and hope for the best.

I have version 18404

Add a line with the word "noauth" to one of the option-files.

Donno, the Amiga had a ROM-based debugger which used the printer or a serial console.
This would be possible on every machine, but would only be useful for CLIs.

Hardly the ancestor of internet, since the net dates back to before the conception of Minitel. They may be seen as a precursor to personal INet acces, though.

You could connect up to three monochrome monitors on ST with each one
displaying independent picture in low res (320x200) or two monitors in
medium res (640x200)
From hardware point of view, it would be pretty simple (just some soldering)
but writing software would probably
be difficult.

You could connect ST with each colour output driving its monitor, So red
would go to first, green to second
and blue to third with all three sharing common sync...

Regards,

Branko

No. You would need more than just software to do that. There's no way you'll get an ST to work that way.

On a system such as the TT or MegaSTe, the native video is a totally separate entity from video on a VME card, thus you can have two separate displays. Normal ST/TT display and the output from the graphics card. I assume the same would be for an ST using one of the ET4000 kits or a Falcon with the Eclipse graphics adapter.

HELP!
Does anybody know.Is there any gender changers
to connect a PC monitor to an Atari STe

Can anybody help

Thanks to all

A few years ago I bought myself a nice little Falcon computer (4mb ram, 64mb HD, no FPU). Anyway, recently I've been getting a little love sick for it (it seems a shame to let it sit around doing very little) and have decided to put it back to work ;) As I've been messing about with linux on my PC, www.linux-m68k.org seemed the perfect way to go. But my falcons specs look a bit low :-(.

Any idea where in the UK (preferably near Manchester) I can find a shop who will add an FPU to my machine, or where I can buy one and find instructions on how to do it myself? At the same time it probably wouldn't hurt to add a bit more ram and a new HD. What are the prices like for ram upghrades nowadays, and are there any size limitations I should be aware of when buying a new 2.5" IDE HD? Is the Falcon to PC monitor adapter still available from some places or should I just go searching for circuit diagams on the web?

Thanks for any help you can give me in spending some of my student loan ;)

How on earth did you manage to find an editor to publish a book about the
Atari?

Are you really selling this? Through what channels?

Either blitter or FPU. If your Mega already has a blitter, it's probably for an FPU. You need specially programmed applications to use an FPU, so if you're using it for MIDI, you won't gain anything by adding an FPU.

> 2) Below the abovementioned connector there's a narrow connector marked
> "J15". I suppose this is the "MegaBus" -what can it be used for?

Nothing much nowadays. It was designed for video cards but there aren't any available. It was hardly ever used.

> 3) At the rear end, just by the harddisk (ACSI) connector) there's an

As long as the voltage is the same, is shouldn't be a problem: 3V.

>

No, it should work fine at least up to 2Gb as long as you use a modern driver liker HD Driver. I doubt you would need more than 500Mb on a MIDI system.

It also requires PAL ang GAL chips, which must be programmed with special equipment. If you don't have access to such equipment, you would be better off sticking to IDE. You won't gain muchby going to SCSI, except the ability

```
to chain more units.

Reading the disks should be no problem. STE disks are supposed to be DOS
compatible, although some PCs are a bit picky. If it really doesn't work,
try formatting the disks under DOS (not windows), or use GEM Explorer. The
link is in the Quick FAQ.

The problem is converting files from that WriteOn format to something
readable by the PC. You might want to export them to RTF (if possible) or
plain text first.

Find a dead MegaST (not STE) and use the keyboard from that. It is MUCH
better than the original squishy keyboard.

Details in the Quick FAQ.

You can�t get faster than that without exchanging the CPU. The MagnumSTE
has zero-waitstate RAM access (which is no big deal at 8/16MHz anyway).

>Any idea? What's wrong???

I suspect either one or more chips have come loose in their sockets, or oxidation on the pins is making intermittent contact. I have heard that the video shifter (in the screened can in the centre) is particularly prone to this. Assuming that you have socketed chips (some ATARI boards have nearly all soldered), carefully prise out the chips one by one and clean their contacts, preferably with a glass-fibre pen (available from Maplins and similar electronics parts stores). Alternatively a contact cleaner solution might do.

Be *very* careful not to snap the pins as they are fragile; support them on a hard surface while using the pen, which is easy when doing the 'inside' faces but needs a thin strip of wood or plastic etc, securely clamped, when doing the 'outside' faces. Also make sure when inserting the chips back in their holders that they go the right way round (it's a good idea to mark them before removal with a small spot of Tippex or similar correction fluid, making a matching mark on the board), and that all the pins actually go into their sockets - it is easy to bend them and miss, as I know from personal experience when fitting TOS 2.06 chips to my STFM!

If you are afraid of stripping the machine down, try the infamous drop trick: Lift the machine some 10 cm above the table and drop it flat once or twice. Often this re-seats the chips or re-makes intermittent contacts.

Good luck!

Regards, /Peter/

Hmm, I remember installing a IDE-drive in a STE belonging to a local
music-school, and Notator (a rather old version) crashed if the blitter
was enabled (this had nothing to do with IDE though, it crashed with 1.62
and ACSI as well).

> But 16MHz is still seletced, not 8MHz!
> Then again, without the cache on, the speed increase is minimal

I used to own a MSTE, and I can assure you that if you disable the cache
you won't notice any difference between 8 and 16MHz.

Hi Nicholas

As far as I am aware Roy did all this himself. I pride myself as being amongst his first customers for "The Guide" and still use the first issue. (I must try and get the update pages now I have STIK 2).

Roy is noted for his work for fellow ATARIANS he maintains the Zetnet-Atarians List and Archive of Zetnet-Atarian Mails, He also for a while "conspired" to carry on running the AWC (ATARI Wrinklies Club) (This was a Club for those of us whose brain cells are showing their age) He still has a "Wrinklies" page on his web site.

DOIT_ST contains schematics how to connect displays to an ST.

Hi!

Why not STE? I use MegaSTE keyboard and it works great..

>> There is a BIG difference.
>
>I can load a newer TOS from disk?

Yes! TOS image files can be found on the Net and there are also various "loader" programs- though I hear that not all will always work. I think that Pera Putnik has loaders for several TOS versions on his page.
There is also on Atari ftp sites a TOSPATCH program that alows you to customize TOS2.06 in some details and to correct several bugs. It also includes a loader. A nice detail is that it can make TOS2.06 reset-proof, so that, once loaded, it will stay in RAM most of the time, except in some severe system crash. I use it like that on my Mega.

Before I installed a hard disk I sometimes used an auto-loading reset-proof "bootable" RAM-disk that was seen by the system as the C:\ hard disk.
On this I put the desktop-icons file used by TOS, desk accessories such as the control-panel, auto-folder programs, a couple of often-used utilities,etc. It made work more comfortable. A setup like this should leave you with more than 1MB RAM free on your 2MB Mega.
You may launch NVDI this way, though then the things become a little bit too tight in RAM and on the floppy.

>> By the way, you are in the US, aren't you?
>
>Good grief no!
>Note the UK email address.

Oh, I didn't notice. Nice attitude, btw :)

>> Ahm, a positive attitude towards hardware hacking seems to be a
>> prerequisite for an Atari user :)
>
>I think I won't be one, then...

I think you should try using it first as it is. Then, if you like it, maybe you will resolve more easily to make some upgrade. A Mega with floppy only can be used quite efficiently. The DS/DD floppies are usually formatted to 820-840KB, and even, if you have been lucky with the floppy drive, to 924KB (84 tracks x 11 sectors). This was quite reliable for me. Wit a HD-floppy modification, it this can be doubled.

But this discussion sems to be steering away from the original problem: can that Mega be made to work. If it can't, all this talk is pointless.
So- did you have some success in making it operational? It would be a pity if it can't work. In my opinion, it is a very pretty-looking little computer with one of the best keyboards that I have ever used.

>Ah! That would be good, but again, probably too expensive. Thanks!

The sad truth about Ataris is that all expansions, unless done by yourself, were always a bit too expensive. Especially adding a hard disk, because of the high prices of SCSI host adaptors. :(

>I already have an ST - CGA cable, bought from my local high-street
>electronics shop (Dixon's.) In fact, I have two

Ah, so you, at least, already have that funny DIN connector. Below is an extract from a file I found among some docs, describing the VGA connnection. I didn't use this, so I can not guarantee that everything is correct. E.g. I seem to remember that the three resistors mentioned here should not have the same (47ohm) value if you want to get a correct white n ST-High on a colour VGA monitor.

--- quote:

The ST series has the following video connector:

```
 4  3  2  1

 8  7  6  5

12 11 10  9

     13
```

1=audio
2=csync, or when the ST has a TV modulator, then it is composite video
3=port A bit 6 of sound chip
4=monochrome sensor, low = SM124 monocrome monitor
5=audio input (no a/d!!!, only mixed to audio out.)
6=green
7=red
8=+12V (TV can detect if a video signal is present)
9=hsync
10=blue
11=monchrome video = SM124
12=vsync
13=ground

VGA has the following pin out:

```
\   1   2    3   4   5     /
 \    6    7   8   9   10 /
  \ 11  12  13  14  15   /
```

1=red
2=green
3=blue
4=not connected
5=digital ground
6=analog ground for red

7=analog ground for green
8=analog ground for blue
9=not connected
10=digital ground
11=not connected
12=DCC data in/out
13=hsync
14=vsync
16=DDC clock

(DDC=Display Data Channel, so Windows 95 detects PnP monitors)

Connect the st connector to VGA connector with the same function following the above listed connectors. All connectors are viewed from the solder side. On the VGA you use digital ground to the ST ground. This will do color lowres and medres resolution.

Note: The most actual VGA monitors can NOT show 15kHz horizontal sync as the ST does in low and medres

Monochrome highres resolution on a VGA connector.

link ST hsync and ST vsync to the same pins of the VGA connector
link ST monochrome video over 3 x 47 ohm resistors to red, green, blue, one resistor for one color!
link ST monochrome sensor to ST ground
link ST ground to VGA digital ground.

For email purposes remove the <.nospam>

MfG Mathias

The batteries don't get charged! Look at the schematics. There is
a diode that prevents this.

What TOS was the Atari computer that wrote the Atari disks? I can say that TOS 1.4 and greater (or was it 1.2) writes a PC boot sector on the disks when they are formatted, so the disks should be able to be read as they are. I do that all the time with disks I create on my STe and Hades in which can be read by my wife Pentium PC.

I fitted one of those Reflex cards into an ST (it was in a Tower case), it drove
an A4 monitor - very nice. A lot of soldering! :-)

I'm busy with putting my Atari Mega Ste, Atari 1040Stf, Amiga 500, MAC ED on the internet. Therefor i use a 486 with linux, so i can use PLIP and SLIP from all four machines to the 486, the 486 is hooked up on the net with a normal coax-ethernet on my other 486 server...

I guess the backlight doesn't work anymore? If it suddenly stopped working it's probably the power converter that has died. This happened on one of my Stacys, and when I replaced it the screen was as good as new. If the backlight has weakened over time it's the EL-film that's dead. You can replace this if you can find someone who sells them. If you do, please let me know...

This point has been raised before. Does anybody know anything new about
it? ESPECIALLY concerning "getting sensible image from the shifter".
Once all the chips have been fed their respective clock signals at
proper frequencies, this seems to be the only problem left. If, as you
say, the resolution is increased, this should mean that sync rates

remain unchanged (i.e. 71Hz vertical at monochrome) so that more pixels are pushed within the same sync frame. Yet, people have talked about increased sync rates after this modification. Also, I suppose a piece of software would be needed to handle the new video parameters. Would overscan/lacescan driver(s) and/or hardware handle this? Would the whole conraption also work in colour (RGB output) mode?

Cu.

I consider the shifter to be a parallel to serial shift register. The shifter gets it's sync signals from the GLUE, so if you speed up the board by changing the clock frequency from 32 MHz to 40 or 48 MHz (remember the shifter takes in 32 & divides it by 2 to produce 16 MHz), the GLUE sync pulse timing will change by a proportional amount.

>Once all the chips have been fed their respective clock signals at

>sync rates after this modification.

Yes, the syncs, if left unchanged, will be (for a 12 MHz motherboard) 75 Hz vertical, 23,437.5 KHz horizontal for (what used to be 50 Hz) low res. Mono mode will be 106.5 Hz vertical, & something like 48-52 KHz horizontal, (I apologise for not remembering the exact frequency).

Usually, some hardware is used to change the syncs back to rates suitable for Atari monitors, although the SM124/5 should be able to handle the higher rates if adjusted. Most PC monitors won't sync below 30 KHz nowadays.

The hardware can be simple, e.g. an EPROM programmed with data values which simulate sync pulses. By incrementally adressing the EPROM, the data is read out & looks like sync pulses to the shifter. It does not appear to matter that these pulses are not synced to the motherboard clock anymore. You can program many different scan rates into the EPROM, selecting whichever resolution you desire by varying the address lines.

AFAIR, Lacescan just combines the existing sync pulses, to produce a slightly wider pulse. This hardware, plus the software, allows it to extend the screen width in the horizontal & vertical directions. However, the scan rates do not change.

Also, I suppose a piece of software
>would be needed to handle the new video parameters. Would overscan/lacescan
>driver(s) and/or hardware handle this? Would the whole conraption also work
>in colour (RGB output) mode?

I guess what you are asking, is whether Lacescan will work if the main board clock is changed to 10 or 12 MHz? I guess it would, but the sync rates will still be wrong. When I looked at this idea several years ago (back when I had time to hack the Atari), I thought it might be a good way of increasing the low res screen size.

My intention was this:

Speed up the main board to 10 or 12 or even 16 MHz. Originally, it was thought that 14 MHz was the fastest the ST could handle. Perhaps some of the later STFM models can even be pushed to 16 MHz. I have ran an old (1989) STFM at 12 MHz as an experiment & it worked fine (but my monitor sould not handle it so I I stopped). If I built the EPROM sequencer & programmed it to provide the correct sync pulses, I would be fine.

I then thought the EPROM idea was not very flexible, so I looked for a hardware solution. There are sync generator chips available, in fact somebody did commercially produce an overscan circuit using the old Motorola 6845 video controller. They used the chip to produce new sync pulses,as it is fully programmable.

Then I though the internal ST sync registers might be programmable over a wider range. They are not, it seems, but there is a possibility of injecting an external sync for genlocking to an external video source (but that's another story).

So, if you speed up the main board to 12 MHz (almost guaranteed to work) & change the syncs back to the original values & use Lacescan to expand the syncs; you might get as much as 600 or more pixels across & perhaps 380 lines down. Thats about 3.5 times the original screen area.

Running the main board @ 16 MHz is even better, because @16 MHz, the horizontal rate is now 31.25 KHz, most PC VGA monitors can handle this. The vertical rate is 100 Hz, not a problem for most monitors. So, without any change to the video circuitry, you have a machine thats twice as fast & can use a PC monitor.

Unfortunately, the screen size is still 320 x 200 for low res. Using Lacescan hardware & software, you should be able to get at least 420 x 284. If you now start changing the syncs, you might expand the screen to VGA size.

Of course the lower horizontal rate means the PC monitor won't work anymore, so you need an Atari type monitor which can sync down to 15.625 Hz, the old NEC multisync could do these rates.

To get VGA resolution @ proper VGA sync rates, the shifter would have to have a 128 MHz input clock. I don't think the original shifter will go this high. If it did, that would be something, as the processor would be clocked & 32 MHz. I don't think this is possible with the ST, the other devices will not work. It might be fun to try, though.

Fortunately, at least this part is simple.
Most modern PC monitors will easilly handle just increased scan rates, although
16 MHz with unchanged syncs (62.5 kHz hor. 144 Hz vertical) might pose a problem
for 15" and most 17" models.
But at least at 16MHz color res. becomes accesible :-)
Ordinary PAL when speeded up 2x becomes VGA-like, at least with regard to syncs.
I did once circuit that enabled the ST to have color output to be active all the time-even
in mono res. Using that I have connected my ST to old EGA monitor and had all res solution.
Modern VGA�s can�t go PAL, but with twice speed-up it could be done.

BTW: ST connected to EGA monitor ROCKS!

Color resolutions look much better than one would assume, looking at numbers (e.g. measly 640x200x 2bp). This is due to much maller dot-pitch of EGA/VGA monitor.

Mono res does not look so much improved, compared to color, but is still much better, provided that monitor is not crap.

Improvement is smaller, because picture format prefers monokrom monitor (1 bit per pixel-no shades) and because software is using raster techniques to get gray. Many times this raster interferes with physical dots grid and cause Moire effect, besides that, picture is not so contrast as it could be on modern monokrom monitor (if such creature exists), because phosphor fill factor is less than 100% (there is clearance between dots and also all 3 components have separate non-overlapping dots).

But as a counterpoint, monokrom resolution looks very nice with Overscan. IIRC I have got at 8MHz something like 700x500. It looks much better than one would judge from numbers.

With 16 MHz it could be really cool...

I have used receipt, shown with Lacescan and it WAS timing sensitive.

If I used chip that was a little bit on slow side (GAL16V8-25ns instead of 15ns) picture was not on the center off the screen every time. Even worst, it used to make 16-pixel jumps to left or right as machine warmed-up...

Lacescan can "eat-up" black border between the picture edge and the physical screen edge. It does not change refresh rate or line rate (although with different implementation it could), it just enables the machine to "spit pixels" oven on the area,

that was before reserved for monochrome border.

As I said, almost any modern 15" color VGA monitor could handle the rate increase even in worst case (no huge overscan) at clocks up to some 12 MHz...
One woulkd have to rearange some bits around shifter (nothing much)....

It can be done with CPLD. Is anyone willing to play if I provide binary file for the
chip ?
Either Lattice or Xilinx can be programmed through the simple cable from PC..

I have had playing with idea to implement the videoshifter inside CPLD chip, but I could not implement RAM tables for colour palletes, so I did not wanted to bother further.
It could probably be done with something like Lattice 1016 or Xilinx 9536.
Those parts are cheap, programmable and have no problem with 128MHz (almost) even without power supply ;-)

I bet it only happens after you have not used the keyboard or mouse for some time. You almost certainly have a screen-saver program (in the AUTO folder?) and the remedy is to disable or remove it! I know that Harlekin's screen saver works like this, and there wil be others too.

>on the web?

I am not sure, but I think the FPU socket is fitted and you only have to plug in the correct chip. Sorry, I don't have the details, but it's a standard FPU. But note that there are only a very few applications for the Atari that can make use of the FPU!

RAM can be expanded easily to 14 MB, but needs a hardware mod board - try System Solutions. The RAM itself is cheap, the adaptor board isn't. I have fitted a 6.4 GB drive in my Falcon. Actually I used a 3.5" IDE, which will just about fit on top of the shielding, with an adaptor for the connection from Abingdon Synthesis Projects. I just wrapped the drive in some thin card and placed it on top of the shielding - it is held in place by the case. So far no problems after several months of heavy use - but then my Falcon has a fan over the power supply that removes heat from the interior. Chris at ASP or Sysol should be able to supply the monitor adaptor - and possibly PC shops too, as it's a standard 19-pin 2-row female to 15-pin 3-row female cable.

| Obviously, I don't want to open up the computer and change batteries
| every 2 weeks ;-)
| They should last several years if possible.

Power consumption is very low.
The standard batteries go for years.

I use the Panasonic BR-2/3A Lithium batteries (stubby AA type) I bought from
Conrad once very cheaply, they have wire ends.

| > a diode that prevents this.
|
| Good thing we got that sorted out.
| I began wondering when there was a battery compartment lid in the
| machine -they're usually just there when ordinary batteries need to be
| changed.
|
| Getting back to the "button" type battery I want to use instead (it
| saves spaces and looks neater).... there are loads of batteries to
| choose from, but obviously I want to get hold of a common, easily
| available and reasonably priced type.
| - CR-2025 3V lithium 170 mAh
| - CR-2032 3V lithium 230 mAh
| - CR-2430 3V lithium 280 mAh
| - CR-2450 3V lithium 560 mAh
|
| These are all readily available for a reasonable price, but as I have no
| idea how much power the clock draws (I guess it only draw power when the
| computer is off), are any of the above suitable?
| Obviously, I don't want to open up the computer and change batteries
| every 2 weeks ;-)
| They should last several years if possible.
|
| Alternatively, there are "photographic" batteries available, which
| basicaly look like short "AA" cells, but with 3V and capacities from 185
| mAh to 1300 mAh. I guess a battery holder for these would be harder to
| find though, and I'd prefer the more common button cells if power is
| sufficient to hold a while.
|

I need to find a way to read Atari 520ST disks into a Mac or PC.

My disks work fine on the Atari, but on the Mac and PC they appear to have only 56K of readable space, and no files on them. I've tried several machines, and could not find a way to access them.

I've also tried NoSTalgia 0.65 PPC (with its connected TOS.IMG), but it would not read in the disks. Nor would DUST 1.0.4 read in the disks.

I may not be using these tools right, or they may simply not be the right ones.

Can someone give me some assistance, PLEASE!!!

Rick

: This point has been raised before. Does anybody know
: anything new about it? ESPECIALLY concerning "getting
: sensible image from the shifter".
: Once all the chips have been fed their respective clock
: signals at proper frequencies, this seems to be the only
: problem left. If, as you say, the resolution is increased,
: this should mean that sync rates remain unchanged (i.e.
: 71Hz vertical at monochrome) so that more pixels are
: pushed within the same sync frame. Yet, people have talked
: about increased sync rates after this modification.
: Also, I suppose a piece of software would be needed to
: handle the new video parameters. Would overscan/lacescan
: driver(s) and/or hardware handle this? Would the whole
: conraption also work in colour (RGB output) mode?

Your last question first: yes.
The question of what happens when the video shifter is driven with a higher frequency is resolved by the use of an electronic sequencer, which will be used to set things to right. A table in EPROM, or rather several tables, for the various modes that the shifter would be expected to output. One for the standard 640*400, one for the extended mode of a 10MHz machine, another for a 12MHz resolution. These latter would be overscanned.

Yeah I think the socket is there, ready and waiting, but I'm not as
confident messing with the insides of my Falcon as I am with my PC. The
problem mainly arises from the fact I have no idea where to get one from. I
suppose Maplin could probably get one. The only reason I'm looking for one

is that the m68k linux port needs an fpu.

So I take it the Falcon dosnt have any real problems with HD size :-)

Cheers m8, I'll look into it.

I am thinking of upgrading my 520 STE to 4 meg.

Do I have to cut any tracks on the board?
Does it have to be 4x1meg simms?

Thanks

Please reply to sender as well as newsgroup. Thanks.

Hi!

I was going to build the ESSC port on my computer until I saw the
special Z85230 chip that is needed. Can't find it anywhere so I'll be
sticking with the RVSE upgrade. RVSE doesn't let the port go any faster
than 56K but then thats all I need for my modem and I don't need LAN.

Hi!

If you have SIMM sockets (rare to have SIP in STe) then it's just a matter of buying 30 pin 1 Mb SIMMs like the ones found in old 486's and 386's. You can find them in your local computer shop very cheapy.

Doesn't the creation of sync pulses in a ST also involve a timer in the
MFP chip, which has a separate clock that can be independent of CPU clock?
That part is not quite clear to me.

Hi Steve,

I must correct myself. Having opened up my STFM I find that the 6 ROM chips are socketed.

However, I am not sure which is "the first socket" of the original TOS ROMS. The pcb is labelled H-0, H-1, H-2, LO-0, LO-1, LO-2 reading from the front of the board towards the PSU.

I have tried pin 20 of H-0, LO-2 and LO-0 and in each case the machine booted into TOS 1. I didn't want to take any further risks by testing the remaining chips sockets.

So either I have not yet found the correct socket or I need to disable the existing ROMs.

Regards,

Peter

Hi to all. Sorry, I can�t see original question (my newsserver sais:"No Such
Article...")
But if it�s about having only TOS 2.06, you should use either CE pin on original
TOS or
simple circuit to replace it.

TOS has 192 Kb and it�s divided in three sets of 64 Kb each (2x 32Kb).
So each set has 32x 16 bit. You have to use CE from first set. On your machine this will be chips H0 and L0. I think it�s pin 20 on both chips. If I�m right, pin 20 on both sockets should be connected . If you plan to use it, you should pull out or at least deactivate ROM�s in first pair (H0/L0). If you want to keep them in, you must pull out pin 20 on both EPROMs and connect between each CE pin and +5V (pin 28) resistor of say 2K2.
This will keep TOS 1 inactive.

Regards,

Branko

The Happy Computing's cartridge is called the Dicovery Cartridge and is the ultimate in disk backup. It only requires ONE disk drive and can copy ANY, and not just Atari! disk to the disk OR to a file.

It also enables you to have another 2 floppy disk drives, depending what version of the cartridge you have. They made 2 types: a small one which was a basic cartridge, and the full one that came in several models:

The basic model had no add ons or a pass-thorugh port, the full model had a built in clock, ports to add up to 2 extra dirves, a through port and sockets to add cartridge chips (mainly aimed at the Mac operating chips).

They were made by the same company that brought us the Happy board for the 8-bit Atari's disk drives. In the UK their distributor were in the Birmingham area and the startingprice was �380 GBP's!!!

the Ultimate Ripper produced by Power computing was a cartridge that allowred access to the Atari's memory to enable ripping of pictures sprites etc.. There are a few serious tools built in it that you woul dneed to know how to use them to use htem.

It also had a couple of undocumented features that, Power Computing didn't know about and don't particularly care; along with the bugs. They went on to produce a combined cartridge that contained Supermon AND the Ultimate Ripper. This cartridge is BUGGED to hell and the ripper side shoul dbe treated as suspect.

I pointed this out to them, when it was first released, and they weren't bothered! they said it was down to the electronics and that it could be possible to combine them on one set of IC's without these problems!!! Amazingly I managed it without any problems.... So much for Power Computing!

I would also be interested in the lastest version if they every got around to making one!

Yes, I have one of these, but seldom use it. But I wonder whether the
original poster was referring to something like the Blitz Turbo Copier
that was said to copy any 3.5" disk? Have one of those around too - just
a lead with 2 floppy connector plugs on it and some software IIRC; did
it plug into the cartridge slot?

Hi

The Blitz lead requires an external disk drive and isn't very efficient. It
can't copy reaonably protected disks and it does verify the track it has
written. This leads to some duff tracks.

Then there's syncro Express, again this needs an external drive but does
back up more than the Blitz does, it also verifies the track. So disks can
take ages using it though and although verifies the tracks, it still isn't
100% reliable.

I don't think any cassette prgs were ever made for the ST. Check your
crossposts please!

This sounds like Calamus was moved from the directory it was first installed on. I didn't follow this thread, did you try to re-install the package from disks?

Hi all..

Don't laugh.. trying to put a 1.44 FDD in a 1040ST. Have it basically working using a simple 2 chip FDC clock doubler circuit, TOS 1.04 and a software patch.

I'm seeking opinions on the best 1.44 hardware mod/patch & software, and where to get same from. Have no problems building own hardware... am electronic technician, so complexity no problems; main goal: booting from a 1.44 reliably...

>

>
You want to make copies of data file cassettes? Play on one and record on the other. (which is how I used to make copies of Zaxxon 15 years ago, their ridiculous copy protection only made loading the game harder to do). The cassettes are audio. You might want to clean the heads on the cassette players, it don't take much to screw up the recordings.

Hi,

There's nothing to laugh about really. Lots of us have done it.

> I'm seeking opinions on the best 1.44 hardware mod/patch & software, and

I'm sorry, I don't understand really what's missing. If you have the circuit, the drive, the TOS and the patch, you have it all. You'll find links to this sort of mod in the Quick FAQ of course.

```

Hi Steve,

Good description but you failed to mention how expandable the system
actually was due to the ability to write your own backup files. This was
```

not always easy, however, as you sometimes had to figure out just what
the protection method was and this could vary from track to track !
I actually bought the basic model of the cartridge direct from the
States (I was on the advanced order mailing list) and got hit for 20
quid import duty on it ! However, that still meant it cost me less than
120 UKP in total ;-)
As you said, it was an amazing product and could produce an image copy of
any disk you threw at it - but it was so slow !!!
I sold mine a few years back - I think I got 50 UKP for it...

Jim

LEGAL CABLE TV DE-SCRAMBLER

Want to watch Sporting Events?--Movies?--Pay-Per-View??

*This is the Famous R-O Shack TV Descrambler
You can assemble it from Radio Shack parts for about $12 to $15.

We Send You:
1, E-Z To follow Assembly Instructions.
2. E-Z To read Original Drawings.
3. Total Parts List.

**** PLUS SOMETHING NEW YOU MUST HAVE! ****
Something you can't do without.

THE UP-TO-DATE 6 PAGE REPORT:
USING A DESCRAMBLER LEGALLY

Warning: You should not build a TV Descrambler without
reading this report first.

Frequently Asked Questions--CABLE TV DESCRAMBLER

Q: Will the descrambler work on Fiber, TCI, Jarrod
and satellite systems?
A: The answer is YES. In respect to satellite,
you just get more stuff! There is one exception:
The descrambler will not work with DSS satellite.

Q: Do I need a converter box?
A: This plan works with or without a converter box.
Specific instructions are included in the plans for each!
Q: Can the cable company detect that I have the descrambler?

A: No, the signal descrambles right at the box and does
not move back through the line!

Q: Do I have to alter my existing cable system,
television or VCR?
A: The answer is no!

Q: Does this work with my remote control?
A: The answer is yes. The descrambler is
manually controlled--but very easy to use!

Q: Can you email me the plans?
A: No the program comes with an easy to follow picture guide.

Q: Does this work everywhere across the country?
A: Yes, everywhere in the USA plus England,
Brazil, Canada and other countries!

Q: Is this deal guaranteed?

A: Yes, if you are unhappy for any reason we will refund your money.

Q: When I order, when will I get my package?
A: We mail out all orders within 24 hours of receiving them.

Q: How much does it cost to get the instruction
plans, the easy to follow diagram, and most
important of all the "Using a Descrambler LEGALLY Report".
A: You get the complete 6 page report and instruction package all for just--$10.00

Q: How do I order?
A: Fill out form below and send it, along
   with your $10.00 payment to:

CABLE FREE-TV
12187 S. Orange Blossom Trail #116
Orlando Fl 32837

(Cash, Check or Money Order.)

(Florida residents include 7% Florida State Sales Tax)

(All orders outside the U.S.A. add $5.00)

Yes, I did the usual presumption when I said backup any disk to disk or
file! The parameters take a while to figure out how to use, but once done
you save them in a file.

> As you said, it was an amazing product and could produce an image copy of

> any disk you threw at it - but it was so slow !!!

It all depended on what copy method you use, if you only do a detailed copy on the guilty tracks, then it can be a lot faster than Syncro Express. BUT it does verify the track and once you've got the parameters correct will do this disk FIRST time EVERY time.

Blitz and Syncro may try and get a disk copied in 50 seconds, but what matters is it's integrity!

I was told of a newer version of software than expanded it's usage and increase the speed!!! I've not found it yet, but I'm a still alooking:

> I sold mine a few years back - I think I got 50 UKP for it...

I thought of selling mine several years ago, but changed my mind. I will be going through all my software and putting them on CD as an image using the cartridge. that way if my favourite protected, or non-protected software goes down I can re-create it:)

You will probably have problems with disk change detection with most of drives. (Due to non-standard way how ST detects it) .It's possible to solve with simple logic.

Yes, please.

I have made a single-TTL-chip module which feeds the turbo frequency only
when a HD floppy is in and the motor is running- but this doesn't solve the
step-rate problem. i.e. how to you (simply) establish when read/write
is indeed in progress...

I'm using a 74LS12, 74LS74 and a 74LS151 for a 2.88 setup.
Could not beat that with a 16V8 at the time.

Can you point me to extra info on that one ?
I have had some troubles with it on TOS 2.06, but since I have had hard disk
it wasn�t so annoying.
Nevertheless, it would be nice to know how to kill that bug...

Sorry. I have forgot about steprate, simply because I did not have to bother with it.
I only use TOS 2.06, which sets steprate OK by itself.
My thingy detects as a valid condition for 16 MHz clock only when motor is on,desired FDX is selected
(one which supports HD.."jumperable" two inputs on GAL) i.e. FD0/FD1
and when HD floppy is inserted in active drive.
I know that I should use monoflop or something like that to get 3ms pulse for every STEP pulze and feed that into GAL &
use it as a condition in equations, but as said-TOS2.06 works perfectly, so I did not bother...
If I would have to make it today, I would write simple program for PIC12C508 and use it instead of monoflop...

Hello,
ask Bo and Ernest Schreurs about their Cas to WAV converter program...
quite interesting background story !! Besides, copying from (Hifi-)Tape
to Tape is easier and to a digital destination (like DAT, DCC, MD, CDR,
CDRW) is far secure (but wastes to much memory). greets- Andreas magenheimer

P.S. Why not keep the cassettes as original source and use a disk-file
as backup... (if you own the original program, you are allowed to have
backups on any medium)

You can read ANY ST or Macintosh disk on a PC with a small
program called Gemulator Express. I will be glad to send it to
you if that works for you. Sometimes the midifiles don't work
with Windows Media Player but they do with any decent sequencer.

Windows 98 format 720 disks in a different way (why?). I
formatted some disks with Win95 and some with Win98 and only the
Win95 disks worked on the Atari.

And I'll find my files and send to you so we can compare solutions. As I said,
I hoped that yours have something about the step rate.

>Sorry. I have forgot about steprate, simply because I did not have to bother
>with it. I only use TOS 2.06, which sets steprate OK by itself.

Does it, really? I use it too, and I saw (better to say I heard that from
a DD drive's noise) that it was programmed to set 6ms step rate (=3ms with
16MHz floppy clock) by default, but I did not get the impression that it
switched the step rate back when a DD floppy was inserted. Theoretically it
could do so after reading floppy configuration from sector 0, couldn't it?
To make things more complicated, I saw from the files that I got with the
Markus Heiden's TOSPATCH program that TOS2.06 could be made to install a _FDC
cookie, and this can have different values describing the type of interface-
but what is the proper value and what is the effect of this on anything?

>I know that I should use monoflop or something like that to get 3ms pulse for
>every STEP pulze and feed that into GAL

I contemplated a monoflop too, but feared that widely changing temperature
inside the computer box could change the monoflop period enough to either
make the step pulses asymmetric (too short monoflop pulse) or else interfere
with read/write (too long monoflop pulse).

>If I would have to make it today, I would write simple program for PIC12C508 and
>use it instead of monoflop...

Neat, but out of reach of an occasional hobbyst who like to make little
hardware hacks from time to time. On the other hand, it is true that
modern programmable chips can make some once-too-complicated enterprises
much simpler, and seem to have enough capacity to perform more than one
hardware-upgrade task in a single chip.

Yes, but for how long ?
I mean, STEP pulse is sign that clock should be low (8MHz) but pulse itself does
not last 3
ms.
It�s much shorter. It serves the purpose of telling FD unit to make a step and
it�s long
enough to be recognised by
unit and that is not required to be 3ms. So, you need something to force your
multiplexer to
put out LOWfrq for cca. 3ms
after falling edge of the STEP signal...

Well, if you make it 2 ms the resulting step (wait) time will be 2.5 which will be
close enough. Ofcourse for 2.88 it will be 2.25
which may be critical for some drives.

| >

You are absolutely right. I fell in that trap once again. I rechecked my circuit:
that 74LS12 is actually a 74LS123. Oops.

: switched the step rate back when a DD floppy was inserted.

TOS 2.06 (at least the swedish version) does not use 6ms as default. You can see this by using a program like SYSINFO. You need to set the steprate with Bootsie, SETSTEP, Fastcopy or some other program. In BASIC you'd write something like POKE (the byte value of) 0 (into address) XX. Can't remember the value for XX now, but it's among the first 400 addresses. You can also alter the default value inside the TOS code, which I've done. This means of course that a new CRC has to be calculated and put in at the very end of TOS, and new EPROM:s need to be burned. The last option has turned out to be the best of all. It doesn't matter that the steprate is 6ms with 720Kb disks as well. There's no other taxation except a noiser drive (with DD disks).

: To make things more complicated, I saw from the files that I

anything?

Believe that the official Atari solution for HD disks bears the
name of another company, which would imply that Atari simply
bought it from them. The only effect is that you'll get a third
option in TOS'es own disk formatting routine, available from the
Desktop, the entry HIGH CAPACITY or maybe HIGH DENSITY becomes
chooseable.

: >I know that I should use monoflop or something like that to
get 3ms pulse for
: >every STEP pulze and feed that into GAL

I have a hardware schematic somewhere in my cellar which uses a
73LS123, the pulse lenght is steered by resistors and
capacitors. Never built it myself though, because I don't
believe in doing things the expensive, work intensive and
complicated way. Use software!

Simple question.

What software do I need to be able to send a fax from a Milan?

I would like to be able to fax Papyrus documents. I have heard
of Coma, will that do what I want ?

Regards,

Peter

It is not bug in fact, but incompatibility of most of floppy drives with Atari's disk change recognition mechanism.
ST recognizes floppy disk change via WP (write-protect) line. By every vertical blank interrupt TOS checks state of that line. It works only if floppy is not write-protected. But by most of new, (HD) drives WP line doesn't gives any signal while changing floppy.
So simple logic is required. It should pull down WP line, when no floppy in drive - you need to find little switch for detect when is floppy inserted and combine it with WP line.
WP=origWP and DiskDetect . It should be of course with OC output. (open collector). We assuming here that DiskDetect is low when no floppy in drive.
That's all...

Pera

Coma is a very good program. I'm using it for all my faxes which I create with Calamus SL99. Coma has his own fax editor though.

DM 69,-	CoMa Standard
DM 119,-	CoMa Voice
DM 199,-	CoMa Professional

There exist an English version

A good alternative is Starfax which is part of the Starcall package.

STarCall Version 3 ENGLISH:
Terminalprogramm including Fax, Voice and BBS, Point,
Editor, cost calculator, Chat, Voice recorder.
For Atari/Magic/compatibles

---Full version:

STarCall Standard	(Terminal)	< >	40,- /20
STarFax	(Faxprogram)	< >	40,- /20
STarCall Pro	(Terminal+Fax+Mailbox+Voice)	< >	80,- /40

A demo version of both Coma and Starcall can be found on the Belgian ftp-server

ftp://chapelie.rma.ac.be/atari/telecomm/

```
telecomm:
total 3244
-rw-rw-r--   1 ftp        705000 Oct 22 20:08 coma_atari_5.1.0.zip
-rw-rw-r--   1 ftp        546108 Sep  2  1999 j-off304.lzh
-rw-rw-r--   1 ftp           150 Sep  2  1999 j-off304.upl
-rw-r--r--   1 ftp        982421 Apr  7 18:25 star301e.lzh
```

BTW: j-off304 is another fax prog. I believe it's freeware

Hope this help,
Martin

| It is not a bug in fact, but incompatibility of most of floppy drives with
| Atari's disk change recognition mechanism.
| ST recognizes floppy disk change via WP (write-protect) line. By every

| vertical blank interrupt TOS checks state of that line. It works only if
| floppy is not write-protected. But by most of new, (HD) drives WP line
| doesn't gives any signal while changing floppy.
| So simple logic is required. It should pull down WP line, when no floppy is
| in drive - you need to find little switch for detect when is floppy inserted
| and combine it with WP line.
| WP=origWP and DiskDetect . It should be of course with OC output. (open
| collector). We are assuming here that DiskDetect is low when no floppy in drive.
| That's all...

Disk change can be found on pin 34 for a PC drive.

|
| Pera

Not on all drives. I think that some MITSUMI�s have had jumpers for deciding roles

of particular
pins.
DCHG was one of them. There are several differing solutions and in my mind it�s
safest not to
rely on
extended functions (like DCHG and HD signal, for instance)

Regards,

Branko

Yes, on falcon it works well. Papyrus create fax pages simple by an fax
driver, coma pick pages to send. Can�t say anything about milan.

This is taking quite a few steps back, but what method are you using to
get a 16Mhz clock signal to the floppy controller circuit?

My dilemma: one floppy mod. doc (Randy Kwak's also available from the
ST Quick FAQ) recommends using the clock signal from the video shifter
(CO25914) but I the closest thing I have a CO25915 (GLUE) on my STFM
motherboard.. (two older STFMs have CO25912 and CO25913 chips as well,
but I'm guessing these are -all- way off-track!)

Another floppy mod. doc (Zaphod Beeblebrox's; also available from the
ST Quick FAQ) says to use pin 2 of the MCGLUE chip... maybe there's
hope for the first aforementioned STFM?

Which pin of your 1040ST's GLUE chip generates 16MHz clock?

Cheers,
Derek

IIRC CO25913 IS DMA chip. You should seek for CO25914. It is usually
covered with
metallic enclosure, which you should open.

Video shifter generates 16 MHz and I think it goes to GLUE (CO25915)
also....
Don�t know pin numbers by heart though...

The new STFM has a chip in that location labelled CO70713 in that
place... damn! However, the two older STFMs have the CO25914 in that
location! Yesss! Thanks! =)

I'll try swapping chips to see if the pinouts are the same.. and if
something blows up, I have 2 backup boards. <g> These were freebies.

Thanks!
Derek

Well, after browsing through backup files, I could not find full version (for both floppies) but have found version, which enables HD on one floppy position. Difference is trivial, but I did not wanted to change equations without being able to check them in circuit. I have only added a few comments...

I use a program called StarFax that comes with the StarCall package. It works great with Calamus SL. I do not think it would work with Papyrus docs unless you converted them to ASCII. Worth giving it a look though.

Yes you can create faxes with Papyrus. No need to convert the docs into
ASCII first. Papyrus holds a printer driver callled "qfax.pri". Just
select that driver and up you go.
You only have to put a file called 'qfax.inf' in the root of your
bootdrive.
That inf must hold the path of the outgoing fax dir of Starfax.

For instance:

```
QUEUEPATH H:\MODEM\STARCAL3\STARFAX\FAXE.OUT\
```

That's all. Please note the last '\'. It's not a typo.

BTW: Coma can handle QFAX too. Ofcourse you need to change that qfax.inf
accordingly

It even works with freeMiNT/N_AES.

Peter,

Since no one has mentioned another great Fax Program, which is no
longer supported 'Straight Fax Ver. 2.50".  I use this program all the
time to Fax Paprus Doc's and also DynaCad Doc's, in fact I've never had
anything it wont Fax......

Later, Donner......

Maybe that is why I wrote 'can be', not 'is'. ;-)

If a PC (well, clone rather) expects it on pin 34 and a 'PC' drive does not have
it there, will I still call it a 'PC' drive?

But you probably would not be using a 'PC only' drive anyway because of its
lacking ID configurability.

Almost every diskdrive has two handsfull of 'jumpers' (the solder type) to allow
the drive maker to maintain a handfull of diskdrive versions for a variety of
OEMs.
Some drives are automatic, others need the signals at the interface to comply with
the inserted floppy type. It is the latter ones you want to avoid for the atari.

We say PC drive just from convience. Maybe is better saying usual or standard HD floppy drive. Even newer MAC's used such drives, instead old special - probably from price reason.

You think so?

|
| > If a PC (well, clone rather) expects it on pin 34 and a 'PC' drive does
| > not have it there, will I still call it a 'PC' drive?
| >
| Clone is PC too. IBM PC is what you mean.

I used the word clone to distinguish the MoBo manufacturers from the A brand
Pc manufacturers. The latter specify their FD interface to their own
specification.
Why do you think there are so many different FD drives?

| PC's do not expect that signal (for all cost :-)), and work with practical all
| standard drives.

Both the Winbond 83877F and the SMSC FDC37C669 have the DSKCHG signal.
What precisely is a standard drive?
e.g. the Shugart interface had no provisions for HDout and EDout let alone HDin
and EDin.

| > But you probably would not be using a 'PC only' drive anyway because of
| > it's lacking ID configurability.
| >
| We say PC drive just from convience. Maybe is better saying usual or
| standard HD floppy drive.

Well, usual would be a PC drive. What we are talking about are the older drives
that come from discontinued A-brand machines or nonPC (universal) drives.

| Even newer MAC's used such drives, instead old
| special - probably from price reason.

I believe the iMac still uses the old Mac interface.

Craig and I have got it going by setting up fast copy as an accessory and setting it to 3ms. It can only be booted (less 2.06) of a 720. then once fastcopy is in ram no dilemma. What would be ideal is if the old elco drivers were avaliable as the could (I belive), fix the stepping problem. A cookie needs to be loaded on tos 2.06 to enable hd format on desktop, this can be got at Vess's homepage. Tos 2.06 on an ste however is different as a jumper can be set to enable HDD on the mainboard. I dont know which one as I only have a Falcon and STFM's to play with. Any way we are getting there.
What would be good is a boot sector patch to enable 3ms before the thing starts reading the disk structure.
Can any one help?

Thanks
Mark Bedingfield

Really? IIRC iMac does not have a floppy neither necessary interface for it.
I think that one needs USB floppy for iMac.
Older generations of PowerMacs have ordinary floppy, at least the ones
I have seen...

| Really? IIRC iMac does not have a floppy neither the necessary interface for it.

Well, there you are wrong. However the interface may have been omitted on later iMacs.

The first iMacs had provisions for a 20pin header on the board where you could fit (and use) a MAC FDD. This was described in c't 18/1998 page 135.

This instigated me to believe that the old style FDD was still in use on MAC's

The MAC's that used standard FDDs, could they still read the old style disks?
I thought it was physically impossible to read those unless the drive was able to variate spindle speed.

BTW, thanks for bringing this up. I have a faceless SONY FDD with autoeject
which I took for a PC FDD since it has a standard 34 pin connector.
I can use it on a pc if I disconnect the eject motor (else it will eject on every access). So it may be for a MAC after all.

The Original iMac's had the 20 pin STANDARD Mac Floppy Drive Connector PADS
on the Motherboard I don't know if My iMac DV's have the pads or not but the
20 pin connector is Standard for the Mac the Real Apple Mac's have Never
used a standard 34 Pin Floppy Drive the Short Lived Clones Might Have but
real Mac's never have...........
Thanks
Edward Williams

I think that it's much simpler to go in any PC shop and buy 'standard'
floppy drive for 30 DEM, instead searching those your "A-brand machine"
drives.
Making it ST compatible is really simple...

I believe that very few iMAC user uses floppies at all .

There is a little utility called BOOTSIE that does exactly this (and some
other useful things). So you CAN boot from HD floppies treated with it,
regardless of TOS version.

Indeed, what is the optimum duty-cycle for the STEP signal going to a
floppy drive? First I was quite convinced that it should be about 50%
(ON for about 1.5ms in this case), but then I found some data on

step-motors that mentioned duty cycles between 35% and 45%. So what does
a floppy drive expects, as that signal may, or may not, go directly to the
step-motor driver in the floppy? I don't have a 'scope at home so I can't
check it on my computer.

I believe the STEP signal to the stepper motor is not the same signal as the
Interface
STEP signal. The latter signal is only the trigger.

What is referred to here as Step is the time the controller has to wait for the
step to
have completed on the drive before it can resume sending/receiving data.

Hi everyone!

Last year the external harddisk of my atari 1040 st crashed. Few weeks later
a fire destroyed my Atari. lucky me, I found a new one.
But I can't get a connection to the harddisk anymore and I have no utilities
to fixe the problem.
Is it possible to mount the harddrive into my PC and emulate the Atari??

Probably there's something wrong with the FAT's so I have to repair that too. It is known to be possible reading 1040st files into the PC.   Anyone who can help me???????

thanks in advance

DJ

Hi

What a bummer that is.... I lost my entire source for a menu system I wrote for the 8-bit Atari's so I know how it feels.

> But I can't get a connection to the harddisk anymore and I have no
utilities
> to fixe the problem.
> Is it possible to mount the harddrive into my PC and emulate the Atari??

There's no way, that I know know of, to read your Atari drive via a pc:(I did come across a program that was part of the Gemulator that allowed you to read Atari/Mac disks (it claimed also to read the hard drive). It's part of the Gemulator software and you can download a small version that allows you to transfer ONE file at a time:(((((((I can't remember the address, ooops!

> Probably there's something wrong with the FAT's so I have to repair that
> too. It is known to be possible reading 1040st files into the PC.
Anyone
> who can help me???????
>

Depending where yo are in the world, you may try finding someone with an Atari an try and do it that way. Using HD Driver it is possible to format a disk so that it can be read by a pc and Atari, I use it all the time. So what you coul ddo with it the data taking off transferring formatting and sticking the data back on!!

I have an MEGA ST 4 and MEGA STE2...can I to connect with the
et(mail,basic internet...)

with Atari???
What i'm needing for this work?(soft,hardware,operative
sistem,specifications...)
I have PC but now I need a second computer and don't want sell this Ataris.
:)

Can you help me,are there any FAQ or web whis this question???
Thanks
Vanguard

Hi Peter

>Simple question.

Demands a simple answer

>What software do I need to be able to send a fax from a Milan?

I use ST-FAX on my machine, it integrates perfectly with..

>I would like to be able to fax Papyrus documents.

..Papyrus via its ST-FAX printer driver, use Papyrus to Author your docs, print to the
ST-FAX driver, invoke ST-FAX to talk to world.

>I have heard of Coma, will that do what I want ?

I believe its Mega expensive, although looking at the features, maybe deservedly so?.

Hello,

Victine of the sudden dead disease last night the internal Zip 100 drive
(SCSI) blew after only two years of faithfull labour his last breath.
Luckily I still have an old external ZIP 100 which I have some 5 years
now.
Before I buy a new one I'd like to know if that sudden problem has been
solved.

CU
Martin

I'm currently trying to make a card (bit like the magnum) which will allow sts to get beyond the 4mb limit. I don't really have much info on other MMUs so I'm thinking about using an MMu from an old stfm because they have there mmu seperate unlike ste's. But this will only give an extra of 4mb totalling a max of 8. I think it you could also clock this a bit to get a sort of fast ram.

Any body who can help or spread some light on this subject
just email me.
Thanks

Anybody can help me???

My Ste2 out of use for 5 years (but stored in good conditions) now,
don't want boot...At first I thinked on a floppie driver problem...
When Tos,booted...first time,all OK.I used Atari "NORMAL"
like ever,full functionally...NO problems.Reboot and reboot...
But next day don't booted...Disk drive was in silence.No light.
Now,I want Boot...and... white screen and intermitently flashes with
many colours,lines and symbols...again white,and again...:-(
Disk drive are not working.Cannot boot Tos...
First day all O.K. (5 years stopped!!!) and now third/fourth day
and don't want work!!!
Anybody have experienced something like this?
Any idea? What's wrong???

Thanks.
Vanguard

You will find the site already mentioned by Nicholas Bales an
excellent place to start.
I have written a book on the subject called "Users Guide to the

Internet for Atari" which covers the prgs and setting up etc.
As you reside in Poland, conversion costs of currency, and postage
would however make it expensive.

Regards
Roy

Hi!

Anybody out there know of any good memory upgrades for an ste. I've seen the review of the magnum card in AC and I believe they have made an STe compatible card but its not really fast ram, still as slow as the stuff on the motherboard. Does anyone know if there are any schematics around. (checked vezz's page and the launchepad)

Thanks

Are you interested in the Diablo or GDOS? Diablo is one disk, GDOS is
three or four disks.

Try removing and reinserting all socketed chips on the motherboard. You
may have developed oxidation, and the process of removing/inserting
scrapes the legs/sockets cleaner.

If the drive was at fault I would expect you to get a Gem screen with no drive icons.
I would suspect that the chips need re-seating (4 inch drop method or open case and press down all socketed chips), or the memory is at fault (remove simms, clean contacts with surgical alcohol, replace).

Cheers,
Corinthian.

Don't know of any schematics available but "The Upgrade Shop" make the
"Veloce" modification with gives the STe up to 4MB of TT_RAM together with
a 68020 switchable processor bundled with TOS 2.06.

Disassemble it, take a vacuum cleaner and suck it clean from dust, hairs etc. Press down all socketed chips, and disconnect and reconnect the power supply cable.

Hi Hallvard!

I take it its a Mega ST not STe
Are you sure you can fit it in a 19" rack. I bought a rack case for my st and the internal width was 5mm too small. Mega might be differnt though. Mine is now in a nice modified full tower PC (ugh :-)) case. Email me for more on this.

A1) Haven't a clue on what the chip socket is for.

A2) It's probably the megabus as you stated. It should be a 64 way connector (32*2). You can connect things like the ET4000 graphics card with an adaptor. (Does require quite a hefty bit of work). The megabus may sound good but it's only a direct connectiion to the CPU so any st can have one. (like mine :-)). Accelerators can be connected here as well like the mach 16 over at vezzs site. I'm making one for my STe along with an ET4000 adaptor and hopefully 8mb of very fast 16 bit ram.

A3) Seeing as its close to the acsi port its probably for internal acsi drives. Just a little bit dated then

A4) Why do you want to use button cells? You have enough space! Anyway it is possible as both are 1.5v. Just connect button cells the same as the AAs. (paralell or series) Obviously AAs give more power than button cells so they wont last as long. If the motherboard doesn't charge these batteries use long lasting Lithium cells, if it does charge them use NiMH cells.
Contact me if you want a very simple (i mean a couple of components) charging circuit that will "top up" the cells every time you turn the computer on.

The IDE board sounds fine. You should be able to use a CD-ROM and hard disk on the same port. You need to put an extra plug on the ribbon cable and set the drives up as master and slave. Use Metados for cd-rom and hd-driver v7.5 and above to work. 7.5 supports Atapi devices like cdrom and wait for it.......DVD!.

I've managed to get a 48x cdrom and hard drive working and its extremly
fast. My HD seems to report using Qindex faster than a TT Ram Disk!
Contact me for more info.
Crack open that Link 2 because I want to know whats in it too. Email
with the main chip part number and I should be able to tell you want it
is. I expect its a PLD like a GAL, PAL etc. It depends if you can
programmes these chips. I have a GAL programmer.....
Sorry about this being so long :-)

Lyndon (at the grand old age of 15)

If memory serves me right, that should be Blitter chip or more precisely
put-empty socket for it.
Your Mega is Blitterless...

>
> 2) Below the abovementioned connector there's a narrow connector marked
> "J15". I suppose this is the "MegaBus" -what can it be used for?
>

If it is near big CPU chip and has 64 contacts in two rows, then you are
probably right.
IIRC Megabus is nothing more than 68000-bus. I suppose there are several
expansion cards
for it, but they must be rare. I have had never seen one...

>
> 3) At the rear end, just by the harddisk (ACSI) connector) there's an

I think that this connector has all signals from DMA connector. It was meant

for internal DMA expansion (like SCSI interface etc...)

>
> 4) The clock backup battery compromises 2 x "AA" cells. I need to make a

Probably. Better yet, use holder for two AA size cells and insert alkaline
cells in it.
Much more juice for practically the same price...

>
> Or does the clock consume too much power?
>

Mega ST has special RTC chip and thus it does not suffer the same problems
with
battery backing of clock like ordinary ST does. RTC�s consumption should be
minimal...

I have made my own IDE interface with TOS 2.06 exp, which probably looks similar to
other solutions of this type, so they probaly share same problems.
My card was not willing to work with just any kind of HDD. General advice is check
before you buy, but in general I can say that Quantums perform better than average on
ST...
I have tried to use 2.1 Gb HDD (boy, 8 partitions of 256 Mb look nice...), but succesfuly
connected & installed CD.

Regards,

Branko

Blitter. Don't bother though, if you use NVDI or MagiC the blitter is
never used anyway.

Btw. some early Megas (like yours) were shipped blitterless due to problems with the blitter.

> 2) Below the abovementioned connector there's a narrow connector marked
> "J15". I suppose this is the "MegaBus" -what can it be used for?

It's basically just the same signals as you find on the CPU, but IIRC
there are some (minor) timing-differences.

> 3) At the rear end, just by the harddisk (ACSI) connector) there's an
> unused connector marked "J17" -what's this for?

Internal ACSI-connector. I have the pinouts if you're interested.

> 4) The clock backup battery compromises 2 x "AA" cells. I need to make a
> new battery holder to put inside the machine, and in that respect I'd
> like to use small "button" type cells, as used in wrist watches and
> other items. Is this doable?

Perhaps, but since the Mega actually charges these cells it might
overcharge smaller ones. I'd suggest that you simply buy two AA-NiCads
with solder-tabs and make a simple pack, that's the easiest, safest and by
far cheapest solution.

> It would be nice with an SCSI interface as well, but I don't feel like
> buying yet another expensive Link II (or similar) as I'm using with my
> STe.

You can use one of those MSTE/STacy-adapters. You'll have to rewire the
connector though, but I know that some people use these in Megas (Ulf
Ronald Andersson is one of them.).

> Any other suggestions for hacks/add-ons/modifications?

Speed up the entire motherboard to 10 or 12MHz. That was one of my
intentions with that Mega I sold you, but due to lack of time I never did
it. Should be interesting though, and not too difficult. I believe the
biggest problem would be to get a sensible image from the shifter, but
once you inform the VDI about the new resolution (the shifter will also
run faster so in 12MHz you'll get a 50% larger image) it should work. If
the monitor can handle it...

Atari made a graphics-card (1280x968) for their 19" monitor, and Titan made the Reflex graphics-card. I also believe someone made an ethernet-card, but I've never seen one of those.

> Probably. Better yet, use holder for two AA size cells and insert alkaline

> Much more juice for practically the same price...

Don't charge alkalines... OK, the Mega charges at a low rate, so they'll probably not explode, but don't do it anyway.

> My card was not willing to work with just any kind of HDD. General advice is
> check
> before you buy, but in general I can say that Quantums perform better than

The C't IDE-interface works with just about anything, the only problem I've had is that it won't boot Western Digital disks (atleast not the two I've tested). You can still use them but you'll have to boot from floppy or another drive. This is a TOS-problem AFAIK, as the Falcon behaves identically.

Other than that I've never had any problems with it, the only problem I can see is TOS, which has problems with large/many partitions. Anything below 8Gb should work fine though.

"Hallvard Tangeraas" <halln@c2i.net> wrote in message
news:1e9lsm9.8digdn6vaox2N%halln@c2i.net...

: 1) There's an empty socket to the left side (near the
cartridge
: connector) marked "U5". It's a square PGA type socket. What's
this for?

The Blitter chip. Don't bother finding one.

: 2) Below the abovementioned connector there's a narrow
connector marked
: "J15". I suppose this is the "MegaBus" -what can it be used
for?

Graphic cards for instance. There's also a (canadian?) card with
a Motorola DSP on it.

: 3) At the rear end, just by the harddisk (ACSI) connector)
there's an

: unused connector marked "J17" -what's this for?

Internal equivalent of the ACSI connector.

: 4) The clock backup battery compromises 2 x "AA" cells. I need
to make a
: new battery holder to put inside the machine, and in that
respect I'd
: like to use small "button" type cells, as used in wrist
watches and
: other items. Is this doable?
: Or does the clock consume too much power?

Doable, but pointless. Cheapest and easiest solution is to buy a
holder for two batteries (to give 3V) and solder the leads
onboard.

: I bought the machine with an IDE interface built in, so as to
connect an
: internal IDE harddisk and CD-ROM unit. It's the one from the
German
: magazine "C't". Anyone have any experiences with it? Any
specific
: harddisks it won't handle? Anyone tried it with a harddisk
AND CD-ROM
: unit?
: Just for the record, TOS 2.06 is installed on the IDE board,
so there
: won't be any problems booting.

Don't use old Conners (up to around 130Mb).

: (I'm really curious as to what's inside my ICD Link II, but I
don't feel
: like cracking the plastic case open, as it can't be opened
without
: breaking it, or so it seems -anyone tried to open it?).

It wouldn't help much opening it. The Links I've looked into all
had custom programmed chips.

: Any other suggestions for hacks/add-ons/modifications?

A graphics card. Panther has a solution which accomodates an
ethernet card as well.
If you won't be using a graphics card, try Lacescan.
There's a quite advanced 12MHz upgrade you could try.
A HD diskdrive would do good. (My own desing, for instance.)
A PAK68030?
A PC keayboard and mouse interface?
Needless to say, a better PSU is a must for all the drives and
extras.

Hi,

does anybody know a source where to get a new STacy Display?

Ciao

Marc-Ant�n

This looks very much like the information I need to get my STacy
running properly again. Did you ever have any luck digging out that
old information? I'm hoping.   Cheers Bryan

Hi.
My monochrome monitor (Atari SM 125) sometimes (frequently)
inverse the screen black to white and reverse.
Usually I work in NOTATOR SL and that (inverse) is the screen for
RECORDING mode!!! but of course nothing wrong happen.

When screen it's inversed in colours (only one to four seconds) and
move the mouse a little it stop!!! But then return...
Atari works fine.No problem...
Sometimes, this screen problem stop and works normally...

Well,I know this is not a tragedy,but in Notator (my first program)
it's not easy knows when I am "on record mode" or only screen
problem...

Any idea??? Any help??? Any experience like this???

Bye
Vanguard

Some screen savers use picture color inversion to avoid
phosphor on monitor screen burning too early...
Are you sure that you don�t have something like that in your system ?
Some utilities, like mouse accelerators have also screensave function
(Silkmouse comes to mind....)

I believe I was sent that info. Lemme look in my mail archive
and when I find it, I'll add it to my Stacy FAQ (URL below).

> need?

Don't bother, the difference is very marginal. Just try switching the
blitter on/off on your STE.

> You mean there were problems with the actual Blitter chip, or the
> version of the PCB? Will I get problems if I find a blitter chip that is

The actual chip IIRC.

> What numbers on the chip do I need to look for in case I come by such a
> chip?

I have no idea. But as I said, don't bother, it's not worth it. I don't
know if it's the blitter that's crap or the VDI that doesn't use it
efficiently, but you'll hardly notice any difference. Besides, most
music-software tends to bypass the VDI (and ofcourse the
blitter) entirely.

>> Perhaps, but since the Mega actually charges these cells it might
>> overcharge smaller ones. I'd suggest that you simply buy two AA-NiCads

> That would be 1.2Vx2=2.4V instead of 3V.

That shouldn't matter.

>> You can use one of those MSTE/STacy-adapters. You'll have to rewire the
>> connector though, but I know that some people use these in Megas (Ulf
>> Ronald Andersson is one of them.).

> I guess these are hard to come by, and as far as I remember there were

I have three, but I'm not sure if all of them works properly. And I need
two working adapters in my STacys...

> some limitations with the MegaSTe host adapters.

There are indeed. Without modifications they only supports one unit and no
parity, with a couple of simple modifications they'll support to units and
parity. But I don't think they'll work with anything but internal

SCSI-devices with *very* short cables.

> I've downloaded circuit diagrams etc. from Vezz' hardware hack site
> which explains how to accelerate the machine to 16 MHz, but I don't know

IIRC this is only a CPU-speeder. If it doesn't have a cache it'll only speed it up by 5-15%. Accelerating the entire machine to 12MHz with speed it up by 50%, and you'll get better graphics as well.

> Another issue is compatibility with software, such as Notator SL.

That's true, timing would probably suffer.

Hmm, don't talk to me, talk to the guy who gave me that Mega ;-) I wasn't aware of this.

> Are you sure the Mega recharges the batteries? It's kind of strange that

Pretty sure, but as the TT doesn't I could be wrong ;-) I can check the schematics if I can find them.

> What's different with the Western Digital drives compared to everything
> else?

I don't know.

> If I can check out the specs online first and know what to look for I

If you don't buy WD I don't think you'll have any problems.

> According to Mario Becroft's website, describing his IDE interface, it
> has problems with both IBM and Western Digital drives, so I'm uncertain

Hmm, I tried a 8Gb IBM Deskstar on my Falcon and IIRC I didn't have any problems. Perhaps this only applies to certain drives.

> if this will work with the C't interface.... they probably all work in
> much the same way, but you never know.

I believe this is a TOS-problem, not a hardware-problem. Or perhaps TOS imposes some sort of hardware-limitation, I don't know. Anyway, this only applies to booting, if you boot from floppy or another HD you can still use drive.

> drive for the Mega ST, but of course, the more the better. I just won't
> pay extra to get more space which I won't be using.

If you want to buy a new drive you'll have a hard time finding any smaller than 8Gb...

Not the problem in this case I suspect, but this would happen with Calamus if one packed the program with a run-time unpacker. The fix was to rename Calamus with a .prg extender IIRC.

>Since I don't have Calamus I don't know whether it needs patching.
>Maybe you find something at the CENTEK homepage.

The only patch for Calamus is the colour mode driver, Calamus itself needs no patch.

Not the Appletalk port, you'll probably need to use the SCSI 1 port for the
conection to your Falcon, and a terminator plugged into the SCSI 2 port.

For drivers, the biggest range is at Nima Montaser's site

http://www.magma.ca/~nima/

I don't know whether the Mustek driver listed there will work with your
model, an email to nima@canada.com might be in order.

HTH.

Is there a way (ie. a program) that can fix a damaged boot sector on
an ST formatted hard drive? I'm thinking that it would work a similar
way to how DOS/Windows boot disks allow you to do a SYS C: and the
boot disks operating system is copied to the the hard drive and
subsequently you can boot from the HD.

Your help would be appreciated (2 HDs died tonight)...

You can just re-install the HD driver using whatever utility was supplied on the floppy containing your HD software. This will re-write block 0 and re-copy the driver program to C:

I guess the root sector or a boot sector of his drive contains bad data.
If this is the case re-installing a driver won't help since you can't
recover the partition information that way.
In case partitioning was done with HDDRUTIL it's easy to repair the root
sector with the function provided for this case. Otherwise you have to
use a disk tool like SED or DISKUS or whatever to repair the damaged
data.
